1 INTRODUCTION

1.1 Scope

1.1.1 This Generic Quantitative Risk Assessment (GQRA) has been undertaken by Luton Rising (a trading name for London Luton Airport Limited) (the applicant) to support the application for a Development Consent Order (DCO) for the expansion of the airport, the Proposed Development. **Figure 1** shows the location and extent of the Proposed Development boundary. The proposed masterplan for the site is presented in **Figure 2a, 2b and 2c.**

1.1.2 The aim of this GQRA is to quantitatively assess the risks in relation to land contamination identified within the Preliminary Risk Assessment (PRA)[1]. It presents a quantitative assessment by comparing measured concentrations of contaminants of concern against criteria applicable for the protection of human health, ground gas and controlled waters. It is intended that this report is read in conjunction with the PRA.

Area covered by report

1.1.3 The extent of the Proposed Development boundary is shown in **Figure 1** and is described in detail in **Section 2**. The Proposed Development is split into three distinct geographical components:

a. Main Application Site;

b. Off-site Car Parks; and

c. Off-site Highways Interventions.

1.1.4 The findings of the PRA are discussed in detail in **Section 3**. Due to the size of the Proposed Development, it was subdivided in the PRA (Ref. 1) into smaller areas for ease of description. These areas are shown on **Figure 3.** The report identified that the main area of concern with respect to potential contamination is a former landfill site (Area A) and required additional quantitative risk assessment. In addition, the Airport Access Road was identified as requiring additional quantitative risk assessment. Ground investigation (GI) work had been undertaken previously but no assessment of the results had been undertaken to quantify the extent of contamination.

1.1.5 No other areas within the Main Application Site, or off-site areas were identified as requiring quantitative risk assessment at this stage. Background information on the other areas is presented in **Section 3.3**, including justification for not progressing to GQRA.

1.2 Objectives

1.2.1 The objectives of this report are to meet the requirements of a GQRA as defined by the Environment Agency's Land Contamination Risk Management (LCRM) Guidance (Ref. 2) and includes the following:

a. Detailed understanding of the spatial distribution of Contaminants of Concern (CoC) in soil and groundwater within the context of current

site conditions and during redevelopment (i.e. how the distribution alters with bulk earthworks etc.);

d. Quantitative assessment of Potential Contaminant Linkages (PCLs) for soil, groundwater and gas risks identified in the PRA;

e. Refinement and development of a robust Conceptual Site Model (CSM) that considers the source-pathway-receptor linkages both on current conditions and upon completion of redevelopment;

f. Identification of relevant PCLs which require further detailed assessment through Detailed Quantitative Risk Assessment (DQRA); and

g. Identification of Relevant Contaminant Linkages (RCLs) that require additional remedial work or management to allow the proposed development to proceed safely.

1.3 Information sources

1.3.1 Several ground investigations (GIs) and other reports were made available for the assessed areas. These were reviewed in detail in the PRA (Ref. 1). Data from these reports have been used to support this assessment.

1.4 Limitations

1.4.1 This report has been prepared by Luton Rising and takes into account their particular instructions and requirements. The benefit of this report may not be assigned to any third party. All reasonable skill, care and diligence have been exercised within the timescale available in accordance with the technical requirements of the brief. Notwithstanding the efforts made by the professional team by undertaking the assessment and preparing the report, it is possible that other ground contamination or conditions as yet undetected may exist and consequently reliance on the findings of this report must be limited accordingly.

2 SITE DETAILS

2.1 Site location

2.1.1 The application for development consent area is located approximately 3.5km east of Luton town centre and is located around the airport centred at National Grid Reference (NGR) 513400, 221800. **Figure 1** shows the location and extent of the Proposed Development.

2.2 The scheme

2.2.1 The Proposed Development covers approximately 360 hectares (ha). The majority of this land lies to the east of the existing airport, but also included are areas of the existing airport, runway and isolated land parcels north and west of the airport where road infrastructure will be upgraded.

2.2.2 The Proposed Development builds on the current operational airport with the construction of a new passenger terminal and additional aircraft stands on land owned by the Applicant located to the north east of the runway. The Proposed Development will be delivered in two phases with the second phase subdivided (Phase 1, Phase 2a and Phase 2b). The proposed masterplans for the site are presented in **Figures 2a, 2b and 2c**.

2.2.3 Further detail of the main elements, can be found in Chapter 4 Volume 2 of this PEIR.

2.3 Current land use

2.3.1 The current land uses of each of the areas of the Proposed Development are provided in **Table 2.1** and shown on **Figure 4**.

Table 2.1: Current land use of each area

Development Area (see Figure 4)	Current Land Use
Main Application Site	
Existing Airport Land	The airport infrastructure consists of a terminal building, runway with associated taxiways, stands, aprons and hangars, maintenance facilities and airport related offices. A fire station is located in the southwest of the terminal building. The associated business park to the north and west of the main airport area also accommodates a range of aircraft and airport production and maintenance businesses, including two fuel depots and a number of car parks for short-, mid- and long-term stay are provided for airport users.

Development Area (see Figure 4)	Current Land Use
LLAOL Contractor's Compound	The south eastern area of the airport (see Figure 4) is a compound used by the operator's contractors for storage of various items including construction arisings from Terminal 1 improvements. In the east is the fire training ground. South of this are two existing airport soakaways (known as the central soakaway). The north east balancing pond is on the boundary with Area B.
Airport Access Road	Parts of the eastern section is existing carriageways; President's Way and Percival Way, the remainder is on the landfill and is part of Wigmore Valley Park (WVP), see Area A below. Industrial /commercial land use are located on the central section of proposed carriageway and undeveloped land along the western section along Dairyborn escarpment.
A – Former Landfill	This area comprises public open space, known as WVP. Sports pitches are present in the north eastern part of the area. The long-stay car park for the airport is present in the west of the area. In the north west is another car park (operated by TUI). The central and southern part of the site are a County Wildlife Site (CWS).
B – Land West of Winch Hill	The northwest part of this area forms part of WVP. Within this area is a community centre, skateboard park, children's playground and allotment gardens as well as public open space, scrub and woodland areas. The rest of the area comprises agricultural land with a coppice and small woodland in the south, designated as ancient woodland. Winch Hill Fam and New Winch Hill Cottages are located on the eastern boundary on Winch Hill Lane.
C – Land East of Winch Hill	Predominately arable land with some hedgerows/trees. There is a woodland area present which bisects the site. Two agricultural barns are located at the western boundary and a large residential property 'Winch Hill House' to the south of these.
Off-site Areas	
D – Off-site Car Park North	Currently partly occupied by a trailer park for storage of heavy goods vehicle (HGV) trailers on the central and south eastern areas and an area of

Development Area (see Figure 4)	Current Land Use
	car parking and vehicle servicing area along the north western area.
E – Off-site Car Park South	The site is currently vacant, most recent land use was as a compound by the contractor working on the DART. Part of the site is covered with hardstanding and two unidentified structures are also present.
Off-site Highway Interventions	Asphalt carriage-way and landscaping to road verges, see PRA (Ref. 1) for further details.

2.4 Proposed Development

2.4.1 This section presents a description of the Proposed Development and the likely associated earthworks within each of the areas described in **Table 2.1** The extent of earthworks within each of the areas is important in assessing the potential risk to receptors from contamination. As discussed in **Section 1.1.4**, the scope of this report is a GQRA for Area A **(see Figure 3)** and the Airport Access Road. However, the assessment needs to consider works to be undertaken in the vicinity which could impact on Area A and cause potential preferential pathways for any potential contaminants. A description of the Proposed Development is described below in **Table 2.2** and shown in **Figure 2**. The Off-site Highway Intervention works and work on Existing Airport are excluded as detailed in **Section 1.1.5.**

Table 2.2: Summary of Proposed Development and associated earthworks

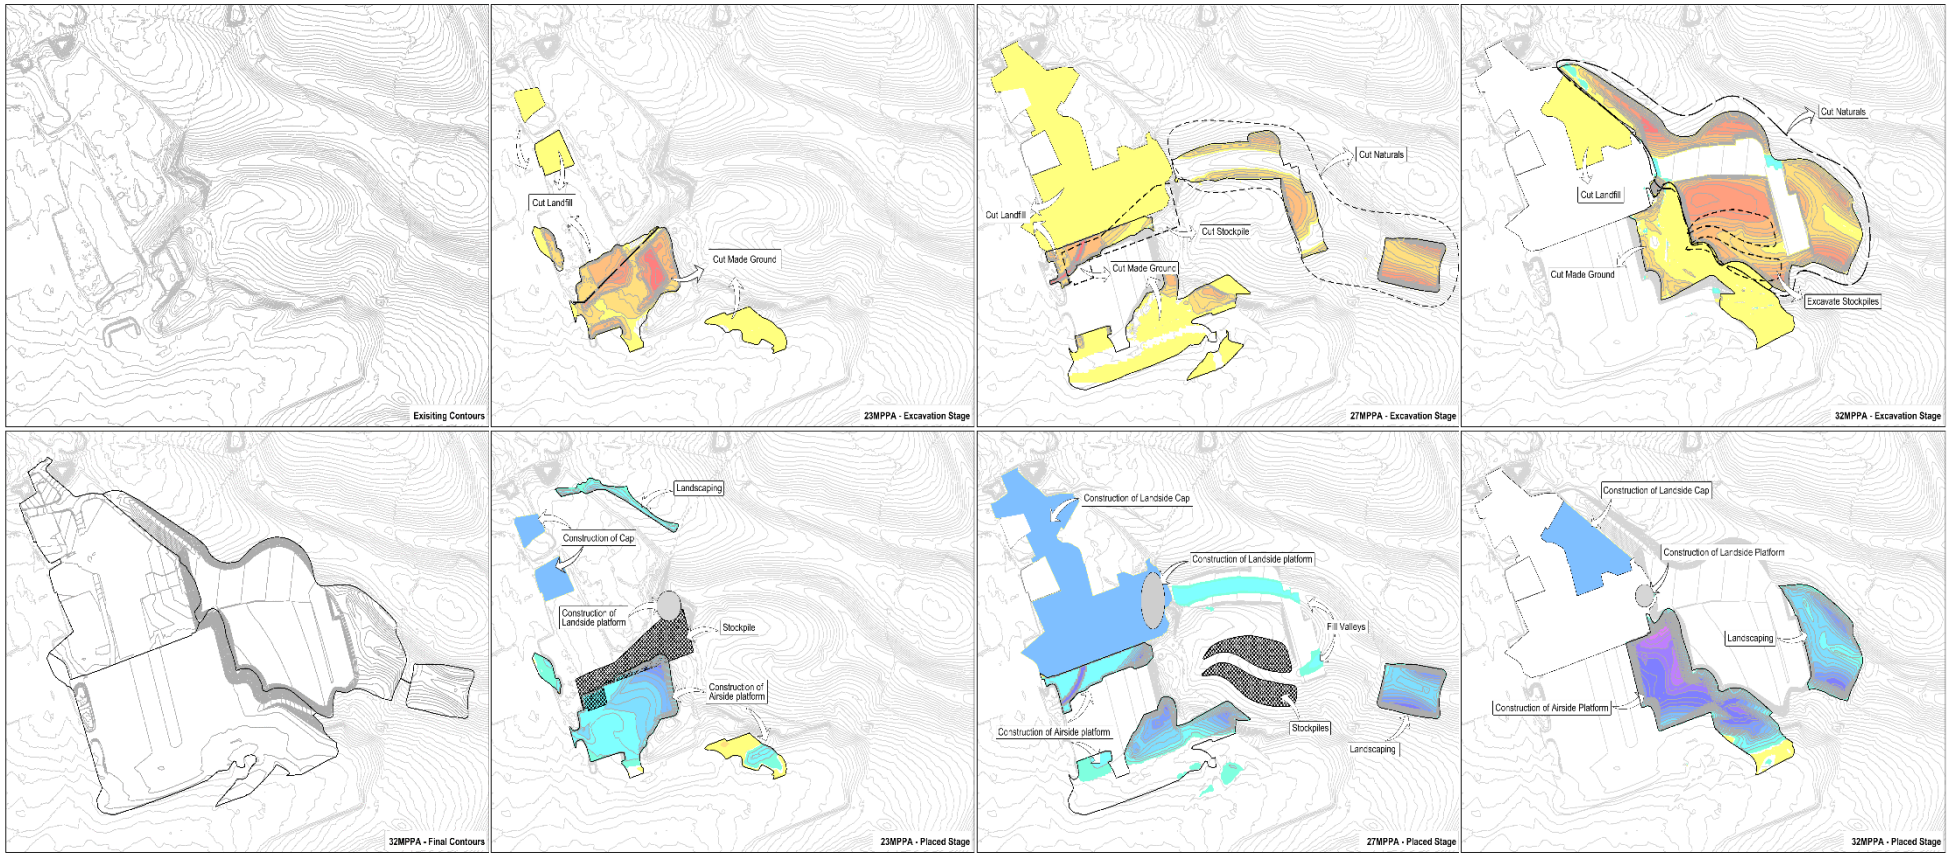
Development Area	Proposed Development	Likely earthworks work required
Existing Airport Land	Improvement of existing terminal area including refurbishment of Terminal 1, small extensions to the north east and south east corners, and a new apron and stands. A section of the DART extension will also be constructed by cut and cover. Relocation of the fire training ground with its associated facilities to the south of the runway. Relocation of staff car park..	Earthworks include piling for the new pier and excavation Made Ground and natural soils for the section of DART. Construction of decked car park. Relocation of the fire training ground is likely to require minor earthworks for construction of the soakaway and associated drainage.

Development Area	Proposed Development	Likely earthworks work required
LLAOL Contractor's Compound:	Apron, piers, stands taxiways and attenuation tank.	Earthworks will be required to create an aviation platform to tie-in with the existing airport levels. Made Ground and natural soils to be excavated and relocated to the southern end of Area A to surcharge the landfill prior to development. Construction of the airside platform with engineering fill (chalk) excavated from Area B for the platform.
Airport Access Road	Construction of new carriageway / duelling of existing carriageway to create a new link road from Airport Way to Terminal 2 (T2) with connections to a series of new access and on-airport distributor roads for T2 and New Century Park (NCP).	Earthworks will be required to create the new link road including excavation to create cuttings and construction of reinforced earth embankment. Excavation of landfill material where road is located in Area A.
A – Former Landfill	<u>North</u> Airport infrastructure car parking, new road infrastructure including eastern section of Airport Access Road. Energy centre, coach station and landscaping.	Excavation of landfill material for provision of Airport Access Road and minor access roads and to create development platform. Piling through the landfill into underlying chalk for foundations to proposed buildings and structures.
	<u>South</u> New terminal building. Piers, apron, stands and taxiways. Extension to the Luton DART to the new terminal and new station. Energy centre, coach station and car parking	Major earthworks to create a development platform to tie-in with the existing airport levels – excavation, processing and relocation of landfill material/ Made Ground to extend landside platform east of landfill and for DART tunnel and station. Import of engineering fill (chalk) from Area B for development platform. Surcharging of landfill with stockpiled soils excavated from LLAOL Contractor's compound.

Development Area	Proposed Development	Likely earthworks work required
		Piling through the landfill into underlying chalk for foundations.
B – Land West of Winch Hill Lane	Ancillary airport buildings. Aprons and stands. Fuel Storage Area Car parking. Water treatment plant Attenuation tank for drainage. WVP community centre, allotment gardens and parkland will be retained. Relocated public parkland.	Major excavation of clay and chalk to provide site-won engineering materials for the airside development platform. Piling into underlying chalk for foundations. Excavation of natural ground for provision of access road and car parks. Some landscaping works will be required for preparing the land to be suitable for re-provision of public parkland. Creation of temporary stockpiles of materials suitable for reuse in construction and landscaping.
C – Land East of Winch Hill Lane	Creation of infiltration basin (below ground infiltration tank).	Excavation for infiltration basin.
Off-site Areas		
D – Off-site Car Park North	Car park.	Potential for resurfacing, re-levelling.
E – Off-site Car Park South	Car park.	Construction of a multi-storey car park.
Off-site Highway Interventions	Junction improvements.	Low potential for minor level change, widening of carriageway, signalisation at junctions. Further details are provided in the PRA (Ref. 1).

2.4.2 A simplified schematic of the earthworks required to create the development platform for the expansion work is shown in **Drawing 1** below.

Drawing 1 Simplified sequencing of the earthworks required to create the development platform for the expansion work



3 SUMMARY OF PRELIMINARY RISK ASSESSMENT

3.1 Desk based information

3.1.1 The PRA involved a desk-based assessment of the potential risks associated with the proposed development using a range of data sources including historical information, regulatory databases and findings of previous GIs and quantitative risk assessments.

3.1.2 This section provides a summary description of the physical and environmental setting of the Proposed Development. This is based on the study area described in **Section 3.1** of the PRA (Ref. 1) and the identified information sources. The PRA should also be referred to for further details.

Table 3.1: Summary of Environmental Setting

Environmental Feature	Details
Geology (Figures 5 and 6)	**Made Ground** is confirmed or anticipated across the Main Application Site, but likely to be absent from agricultural land in Areas B and C and Off-site planting.
	Superficial deposits are present across all areas apart from Areas D and E and generally comprise Head deposits and Clay with Flints. Glaciofluvial deposits are present beneath the Off-site Highway Interventions at Hitchin.
	Bedrock is generally recorded as Lewes Nodular and Seaford Chalk Formation across the Proposed Development.
Mining/Ground workings	The Proposed Development is in an area which has been the location of chalk extraction. The whole of Area A is also identified as an unspecified workings/location of a refuse heap, a small unspecified quarry is recorded in the centre of Area B.
Natural cavities	Solution pipes are recorded as located 15m north of Area A and in Area D.
Radon	The site is not within a radon affected area (less than 1% above action level), and therefore radon protection measures are not required.
Hydrogeology (Figure 7)	Across the Proposed Development the Chalk groups (Lewes Nodular, Seaford, Holywell Nodular and New Pit Chalk formations) are all Principal Aquifers. A groundwater divide is located between the Existing Airport Land and Area A, see **Section 6** for further detail on regional hydrogeology and groundwater conditions beneath the site.

Environmental Feature	Details
Source Protection Zones (SPZ) (Figure 7)	The northern area of the Main Application Site lies within an SPZ3, Areas D and E are not within an SPZ, SPZ 1 is recorded in Off-site Highway Intervention areas at the M1 junction 10 and the A1081/London Road junction.
Abstraction (Figure 7)	**Groundwater**- two active abstraction licenses are recorded within 2km of the Main Application site redline boundary; 1.5km west for general use and 1.5km north east a potable water supply operated by Affinity Water Limited. Further private water supplies are located within 2km, see Figure 7. **Surface water –** no abstractions recorded.
Hydrology (Figure 7 and Figure 8)	No surface watercourses are located within the Main Application Site, the River Lea is approximately 300m south of Area E. Other surface water features on site include Thames Water Compound storage pond and Thames Valley Drain, numerous soakaways are located around the Existing Airport Land.
Environmental permits	Three are recorded to operations on the Main Application Site for operation of combustion plant, coating processes and dry cleaning.
Dangerous or hazardous sites	A lower tier Control of Major Accident Hazards (COMAH) site for storage of Jet A-1 fuel and a site licensed under the Manufacture and Storage of Explosive Regulations 2005 (MSER) are located on the Existing Airport Land.
Waste disposal	Area A was formerly the Eaton Green Landfill, in use between 1937 and early 1990s, wastes disposed included: inert, industrial, commercial, household and liquid sludge, see PRA(1) and previous studies(3) for further detail. An active, waste site is the Tidy Tip, a Local Authority recycling centre located in the north west of Area A, this is currently permitted.
Ecological designations	The following ecological designations are located on the Main Application Site; Area A – County Wildlife Site (CWS) is located within the south east area of WVP and Area B – a designated ancient and semi-natural woodland in the south east.
Unexploded Ordnance	Several UXO reports have been obtained and identify the Existing Airport, LLAOL Contractor's Compound and Area A as Very High risk for UXO. However, it should be noted that where works are to be undertaken within post war fill material/Made Ground

Environmental Feature	Details
	this is considered Low Risk. All other areas of the Proposed Development are Low to Moderate Risk.

3.2 Previous ground investigations

3.2.1 A number of previous GIs were reviewed and summarised in the PRA which covered the Existing Airport Land, LLAOL Contractor's Compound and Areas A and B, see **Figure 9** for GI locations. This identified Area A – Former Landfill as the significant potential source of contamination within the Proposed Development, and further risk assessment of soils, groundwater and gas results would be required to refine the CSM and PCLs. The report also identified that assessment was required of GI data for the Airport Access Road, further detail is provided in **Table 3.2.**

3.3 Preliminary conceptual site model

3.3.1 To complete the PRA a CSM was developed based on the desk study information which identified a number of PCLs as moderate to high risk. A summary of these PCLs is provided in **Table 3.2**. The PRA is provided as **Appendix 17-1** to the PEIR and should be consulted for a full list of PCLs and qualitative assessment of the risks.

3.3.2 As detailed in **Sections 1.1.4 and 1.1.5**, Area A and the Airport Access Road have been considered further in this GQRA report. A summary of justification of exclusion of other areas from further assessment is provided in **Table 3.2**, further details is provided in the PRA (Ref. 1) and the Preliminary Environmental Information Report (PEIR) (Ref. 4)

Table 3.2: Summary of PRA Conceptual Site Model

Area	Receptor	PCLs	Qualitative Assessment of Risk	Additional Assessment /GI required?
Existing Airport Land (including LLAOL contractors compound)	Human health	Inhalation of airborne contaminants by construction workers from Made Ground during construction works.	Moderate	**No** The PRA identified a potential moderate risk associated with excavation of materials during construction works to human health and a risk to foundations/infrastructure from aggressive ground conditions. A high risk from UXO was identified in the LLAOL Contractor's Compound. All of which can be addressed at detailed design stage with additional testing of materials and employment of mitigation and control measures during construction including adherence to a Construction Code of Practice (CoCP) produced as part of the earthworks strategy and measures to ensure that preferential pathways for gases from the landfill are not created
		Driving of piles impact UXO with risk to construction workers/public/airport operatives		
	Buildings/ Infrastructure	Direct contact with contaminated soils/groundwater	High	
Airport Access Road	Human health	Inhalation of airborne contaminants by construction workers from Made Ground during construction works.	Moderate	**Yes** The PRA noted that the areas of the proposed new road (off the landfill) has been subject to GI but no formal assessment of the data had been undertaken. It was therefore recommended that GQRA is undertaken to identify whether there is any contamination issues which require further consideration.
		Direct contact with Made Ground e.g. dermal, and/or		

Area	Receptor	PCLs	Qualitative Assessment of Risk	Additional Assessment /GI required?
		accidental ingestion by construction workers.		
	Buildings/ Infrastructure	Direct contact with contaminated soils/groundwater		
A- Former Landfill	Human health	Migration of ground gases from former landfill into future development.	Very High	**Yes** The PRA noted Area A was the main area of potential contamination within the Proposed Development. A significant part of the Proposed Development will be within this area including the new terminal building and as such a number of very high, high and moderate PCLs were noted. The PRA recommended the following further work: a. Further detailed assessment of GI results; b. Detailed assessment to understand the gassing conditions after work is undertaken to remodel the landfill. c. Complete full characterisation of the landfill waste based on the additional data gathered to inform the detailed assessment of the potential risks to groundwater and also to determine the potential for reuse of material. d. Develop a remedial strategy for the re-engineering of the former landfill material to
		Migration offsite to adjacent residential properties/ existing airport buildings of ground gases from former landfill through preferential pathways.	Moderate	
		Inhalation of airborne contaminants by adjacent site users (e.g. residential housing, existing Luton Airport) and construction workers from Made Ground/former landfill during construction works.	High	

Area	Receptor	PCLs	Qualitative Assessment of Risk	Additional Assessment /GI required?
	Controlled waters	Driving of contaminants downwards during any future piling and via preferential pathways to principal chalk aquifer and lateral migration of contaminants in groundwater to controlled water receptors	Moderate	ensure the potential risks associated with this material are assessed and controlled as to not present a risk to controlled waters or future users of the site. e. Detailed consideration of the gas management measures for the buildings/infrastructure on the Proposed Development. f. The geotechnical risks should be reassessed to finalise any ground improvement techniques/foundation design prior to construction and used to further develop the earthworks strategy for the Proposed Development.
	Buildings	Direct contact with aggressive ground conditions.	Moderate	
B-Land West of Winch Hill Lane	-	No moderate/high risk PCLs identified.	-	**No** This area has no history of contaminative use based on the available information assessed in the PRA. The PRA concluded no further GI or assessment is required for Area B. Construction works should include measures to ensure that preferential pathways for gases from the landfill are not created, as well as to detect, and if necessary treat, any existing features such as drains and other utilities that might be providing a preferential pathway for gases from the former landfill in Area A.

Area	Receptor	PCLs	Qualitative Assessment of Risk	Additional Assessment /GI required?
C- Land East of Winch Hill Lane	-	No moderate/high risk PCLs identified.	-	**No** The PRA concluded this area is greenfield and has only ever been agricultural land. On this basis it was considered unlikely there would be any potential sources of contamination and therefore, no GI for geoenvironmental purposes or further risk assessment is considered necessary
D – Off-site car Park North and	Human health	Inhalation of airborne contaminants by construction workers from Made Ground during construction works.	Moderate	**No** Further assessment or GI for geoenvironmental purposes is not required at this stage.– the PRA indicated there is no GI data available for this area and concluded that based on the desk study information there may be occasional areas of localised contamination from the historical uses and its current use as a trailer park, car parking and garage. The overall risk of contamination was considered low, detailed assessment of contamination risks is not required at this stage in the application for development consent. GI will be required to obtain geotechnical information for the Proposed Development in these areas, prior to construction, this would be coupled with a geoenvironmental investigation to verify existing mitigation requirements and design measures.
	Controlled waters	Leaching of contaminants in soil to principal chalk aquifer.	Moderate	
		Driving of contaminants downwards to principal chalk aquifer during any future piling.	Moderate	

Area	Receptor	PCLs	Qualitative Assessment of Risk	Additional Assessment /GI required?
E - Off-site Car Park South	Human health	Inhalation of airborne contaminants from Made Ground by construction workers from Made Ground during construction works.	Moderate	**No further assessment or GI required at present** – the PRA indicated there is no GI data available for this area and concluded that based on the desk study information no major contamination sources are likely to be present within these areas however an earthworks platform was constructed during the 1940s from material of unknown origin or quality, therefore, there is the potential for this material to be a source of contamination. The overall risk of contamination is considered to be low, detailed assessment of contamination risks is not required at this stage in the application for development consent. GI will be required to obtain geotechnical information for the Proposed Development in these areas, prior to construction, this would be coupled with a geoenvironmental investigation to verify existing mitigation requirements and design measures.
	Controlled waters	Leaching of contaminants in soil to principal chalk aquifer.	Moderate	
		Driving of contaminants downwards to principal chalk aquifer during any future piling.	Moderate	
Off-site Highway Interventions		No moderate/high risk PCLs identified.		**No** Further assessment or GI for geoenvironmental purposes is not required at present. The PRA identified that no GI has been completed within the areas of proposed Off-site Highway Interventions. However the overall risk was been determined as very low

Area	Receptor	PCLs	Qualitative Assessment of Risk	Additional Assessment /GI required?
				to low to future site users/infrastructure as the majority of the sites have shown little potential contaminative historical uses. In addition the proposed works in these areas will not involve substantial earthworks and as such there will be no interaction with soils and groundwater. Any risks associated with contamination can be mitigated during construction by use of site management procedures and personal protective equipment (PPE). Further GI will be undertaken prior to construction, post DCO consent, to inform detailed design and verify mitigation requirements.

3.4 Other risks identified in the PRA

Unexploded ordnance

3.4.1 Areas A and LLOAL Contractor's Compound have 'Very High' risk from UXOs and the risk will need to be addressed further when considering design and construction (Ref. 5). Areas D and E will require further UXO assessment since current assessments do not cover these areas. The Other areas of the Proposed Development; Existing Airport Land and Off-site Highway Interventions do not require further consideration as these areas have been previously developed and most the earthworks are anticipated to be relatively shallow.

Ecological risks

3.4.2 Invasive species have been identified in Area A, including Japanese Knotweed. Further ecological surveys may be required in other undeveloped areas of the Proposed Development as part of the detailed design stage to determine presence/absence of invasive species.

4 GROUND INVESTIGATION WORK

4.1 Ground investigation strategy

4.1.1 Preliminary GIs were undertaken in 2016/17 (Ref. 6)(Ref. 7)(Ref. 8)(Ref. 9) which provided coverage for the Airport Access Road, Area A and Area B. These GIs were reviewed in as part of the PRA(Ref. 1). Following the findings of the PRA a detailed GI was developed to focus on any data gaps and relevant PCLs within Area A, which was identified as the main area of potential contamination within the Proposed Development. The GI strategy (Ref. 10) was presented to the Environment Agency (EA) on 25th March 2018. The EA provided comments which indicated that the GI strategy was comprehensive and would obtain the expected level of data for a detailed assessment. The sampling strategy and minutes from the meeting are included in **Appendix A.**

4.1.2 The GI within Area A was intended to inform the following:

a. Confirm the depth of waste in the landfill;

h. Confirm the geological conditions, including presence/absence of Clay-with-Flints and potential presence of solution features;

i. Characterise in detail the type, age and condition of waste in the landfill;

j. Provide detailed information on leachate and gas conditions both on and off the former landfill;

k. Investigate potential contaminative sources within the landfill including asbestos;

l. Inform on landfill composition for preliminary geotechnical and earthworks design;

m. Confirm the groundwater elevations and condition beneath the landfill; and

n. Build on the existing network of groundwater monitoring boreholes across the DCO area.

4.1.3 The GI was designed to generate sufficient information for a detailed assessment. The detailed GI in conjunction with the previous preliminary GI has generated datapoints at approximately 50m intervals across the landfill for ground gas monitoring locations and 150m intervals for groundwater monitoring locations. This is consistent with recommended sampling grids for a main site investigation (Ref. 11).

4.1.4 The locations of previous ground investigation and the 2018 exploratory holes are shown in Figures 9 and 10. The investigation was split in two phases due to access restrictions. The first phase was conducted between 5 June to 2 July 2018 in Wigmore Valley Park and the County Wildlife Site. The second phase was conducted between 26 November to 14 December 2018 in the Long-Term Car Park (LTCP).

4.1.5 The scope of the GI for the Airport Access Road was developed by Pell Frischmann based on a Preliminary Sources Study Report (PSSR) (Ref. 12). The GI was completed over 2 phases.

4.2 Fieldwork

Overview

4.2.1 A summary of the 2018 GI locations on the former landfill and their purpose, including installation details is provided in **Table 4.1.** The GI locations are shown on **Figure 9.**

Table 4.1: Ground Investigation locations and purpose

Exploratory Hole Type	Purpose of hole	Number of holes	Maximum Depth (m)	Purpose of installation
Cable percussion	Boundary hole	3	20.9	Groundwater monitoring
Roto-sonic	Determine depth of Made Ground, characterise landfill waste and underlying natural ground	17	20.0	Gas monitoring
		4	18	Leachate monitoring
Dynamic sampling (Window sample)		24	5	Gas monitoring
		1	6	Leachate monitoring
	Boundary hole	15	5.45	Gas monitoring
Rotary cored/ Dynamic sampling with rotary follow-on/Sonic with rotary follow-on/ Cable percussion with rotary follow-on	Penetrate landfill and at least 10 m into chalk	5	36.2	Gas monitoring
	Deep boreholes for hydrogeological characterisation – within landfill boundary	5	64.5	Groundwater monitoring
	Deep boreholes for hydrogeological characterisation– not within landfill boundary	2	54	
	Determine depth of Made Ground, characterise landfill waste and underlying natural ground	8	14	Gas monitoring
Trial pits	General characterisation of ground/landfill waste	51	4.5	N/A

Exploratory Hole Type	Purpose of hole	Number of holes	Maximum Depth (m)	Purpose of installation
Cone Penetrometer Test	Penetrate chalk	5	26.2	N/A
	Penetration of landfill	62	22.8	
Dynamic probing		29	18.8	N/A
		15	6	

Note: These exploratory hole quantities are based on number of exploratory hole locations and do not include re-drills, locations that were cancelled, nor where CPT/DP refused early and was re-attempted.

Testing and monitoring

4.2.2 A number of in-situ tests and monitoring were undertaken during the fieldwork, full details are provided in the Factual GI report and summarised below:

During fieldwork

a. Forensic analysis of the waste- in an onsite laboratory (details below in **Section 4.4);**

b. Single Packer permeability testing- packer testing was undertaken at regular intervals in the Chalk strata in seven boreholes (GW201-GW206 inclusive and GW207a).

c. Environmental monitoring- as there was limited information regarding waste content, environmental monitoring was conducted during the course of the works. This included monitoring for vapour and gases at each work site, background dust and specialist monitoring for radionuclides.

d. UXO mitigation- prior to works commencing a detailed UXO survey was obtained, which identified parts of Area A which required specific measures during the works. These measures included the use of a magnetometer equipped CPT cone. Further details are provided in the Factual GI report**.**

e. Ecological surveys- species of ecological importance were identified by an ecologist including orchid, badgers, birds and reptiles. In addition, the invasive plan species Japanese Knotweed was identified in several areas of the site. Exploratory locations near site of ecological interest were surveyed by an ecologist and a watching brief undertaken by an ecologist during the works.

Post Fieldwork

a. Continuous gas monitoring- Five Ambisense GasFlux units were also installed to BH202, BH206, BH208, BH224, & BWS202. The GasFlux units were installed in August 2018 and decommissioned at the end of October/start of November 2018. Purge and recovery tests were also undertaken on the locations installed with the Ambisense GasFlux to inform gas emissions.

b. Spot gas measurements- gas readings for methane, carbon dioxide, oxygen, hydrogen sulphide and carbon monoxide were taken from standpipes using a GFM 435 gas analyser.

c. Bulk gas and vapour sampling- samples of soil gases and bulk landfill gases were taken from specific wells using either gas cannisters or vacuum bottles. Samples were analysed for semi-volatile and volatile compounds.

d. Data loggers for groundwater- data loggers were installed in three groundwater boreholes (GW201, GW204 and GW207A) which measured the groundwater level at five-minute intervals. The data was collected between October 2018 to March 2019.

e. Groundwater samples - were obtained using low flow micro-purging and sampling techniques to obtain samples representative of the chalk aquifer and minimise disturbance to the water column. The samples were tested for a range of analytes including metals, semi and volatile organic compounds (SVOCs and VOCs), total petroleum hydrocarbons (TPHs), polyaromatic hydrocarbons (PAHs), pesticides, phenols, polychlorinated biphenyls (PCBs) and volatile fatty acids (VFAs).

f. Leachate samples- five boreholes (LW201 – LW205) were installed for the monitoring of leachate collected from the landfill waste. These boreholes were installed with slotted pipe through the thickness of the landfill waste with a 1 m plain pipe installed at the base to act as a sump to collect leachate for monitoring and testing samples of leachate. Where present, leachate samples were obtained from wells. The samples were tested for a range of contaminants including metals, volatile organic compounds (VOCs), total petroleum hydrocarbons (TPHs), polyaromatic hydrocarbons (PAHs), pesticides, phenols, polychlorinated biphenyls (PCBs) and volatile fatty acids (VFAs).

g. Radionuclide survey- a survey was undertaken post GI works to follow up on locations where readings has been encountered above background levels. The further survey **(Appendix C**) indicated that the levels of radionuclides detected were consistent with expected natural background levels.

4.3 2018/2019 Groundwater/gas monitoring and sampling

4.3.1 In parallel to the GI a 12-month period of monthly groundwater and gas monitoring was undertaken across the network of boreholes established during the preliminary GIs. These locations were predominately within Area A and Area B, see **Figure 10**. The objectives of this monitoring were:

a. to establish whether there is any migration of contaminants from the landfill site and characterise their spatial extent;

b. determine the direction, rate and variability of groundwater flow and contaminant migration;

c. determine the baseline groundwater level, including variability and trends;

d. determine baseline groundwater quality including variability and trends; and

e. determine baseline gas concentrations including variability and trends.

f. monitoring, sampling and testing undertaken were as follows:

g. monthly monitoring for groundwater levels and samples taken at 17 groundwater quality monitoring points (GQMP);

h. monthly monitoring at 9 gas monitoring points and bulk gas/ SVOC and VOCs samples taken every two months;

i. monitoring of leachate thicknesses and sampling every 2 months at 4 leachate monitoring wells; and

j. obtaining samples of non-aqueous phase liquids (NAPLs), where present.

4.4 Logging of landfill material

4.4.1 Accurate and consistent description of landfill materials was a priority for this investigation, as it provides a vital indication of the material's likely geotechnical behaviour, the potential for contamination and/or the potential for ground gas generation. However, BS 5930:2015 (Ref. 13) and BS EN ISO 14688-1 (Ref. 14) provide only limited guidance on the description of anthropogenic "soils" and there is no published approach for logging former landfill materials.

4.4.2 An approach was developed for use during the GI to ensure consistent description of the landfill waste. This protocol for logging is included in **Appendix D.**

Forensic analysis of landfill material

4.4.3 Samples of landfill material were collected from either borehole core runs or trial pit bulk samples and transported to the field laboratory for forensic assessment **(see Photograph 1).**

4.4.4 The assessment comprised testing of the samples in accordance with Standard Test Method D5231-92 (Ref. 15). An initial assessment of the sample included weighing and sample description for the following parameters:

a. colour;

b. dampness: dry, damp and wet;

c. degradation: undegraded (materials fresh, predominantly in original state), moderately degraded (materials stained, some breakdown of material, some of original components unrecognisable) and highly degraded (materials falling apart, majority of original components unrecognisable);

d. odour: described in accordance with **Table 19** in BS5930-2015 (Ref. 13) (camphor, musk, floral, peppermint, ether, vinegar, putrid and hydrocarbon);

e. odour rating: 0 (no odour), 1 (faint odour), 2 (distinct but not strong), 3 (strong odour), 4 (strong odour discernible in ambient air) and 5 (very strong odour very discernible in ambient air);

f. sample texture; and

g. presence of leachate.

4.4.5 It should be noted that face protection was used at all times by the logging engineers and therefore, weaker odours may not have been detected.

Photograph 1 Sample forensic logging in the field laboratory

4.4.6 Following this initial assessment, a detailed assessment comprised splitting the sample into 14 categories of waste components as specified on the landfill waste logging sheet **(Appendix D)** and each individual component weighed. Observations regarding the presence of potential asbestos containing material were carried out at this stage. The individual waste components would then be recombined, the sample re-weighed and re-bagged for storage on site before final disposal at completion of the ground investigation works. **Appendix D** further details the methodology for forensic waste logging and waste category methodology. The 14 waste categories used to characterise the samples are described **in Table 4.2.**

Table 4.2 Waste component categories (adapted from ASTM D5231-92)(15)

Waste Component Categories	Description
Mixed paper	Office paper, computer paper, magazines, glossy paper, waxed paper and other paper not fitting the categories of newsprint and corrugated.
Newsprint	Newspaper.
Corrugated	Corrugated medium, corrugated boxes or cartons and brown (kraft) paper bags.

Waste Component Categories	Description
Plastic	All plastics – PET bottles, HDPE bottles, film, other plastics.
Garden waste	Branches, twigs, leaves, grass and other plant material.
Food waste	All food waste except bones.
Wood	Lumber, wood products, pallets and furniture.
Biological	Clinical waste, veterinary waste.
Other organics / combustibles	Textiles, rubber, leather and other primary burnable materials not included in above categories.
Construction waste	Concrete, brick, tiles, plaster, tarmac, bitumen.
Ferrous	Iron, steel, tin cans and bi-metal cans.
Aluminium	Aluminium, aluminium cans and aluminium foil.
Glass	All glass – clear, brown, green.
Other non-organics / non-combustibles	Rock, sand, dirt, ceramics, non-ferrous non-aluminium metals (copper, brass, etc), bones, ash, clinker, slag.

4.4.7 The results of the forensic waste analysis are presented in **Section 8.**

Quality Assurance of Forensic Assessment

4.4.8 Selected samples underwent additional forensic assessment in an external laboratory and the laboratory certificates are presented in **Appendix D.**

4.4.9 The methodology followed by the external laboratory split the waste components into seven groups listed below and some waste components were re-grouped in order to allow comparison of results **(see Table 4.3):**

a. Visible cloth and leather;
b. Other degradable material;
c. Visible wood, branches, trees, etc;
d. Visible vegetation, grass, food waste, etc;
e. Visible metal, glass, ceramics and other inert material;
f. Coarse inert particles, including gravel and concrete; and
g. Fine soil including gravel < 10mm.

Table 4.3 Splitting of waste components according to the methodology adopted by the external laboratory and the methodology used in the field.

Laboratory Waste Components	Field Waste Components
Sum of two fractions: Visible cloth and leather Other degradable material	Mixed Paper
	Newsprint
	Corrugated
	Plastic

Laboratory Waste Components	Field Waste Components
	Other organics / combustibles
Visible wood, branches, trees	Wood
Visible vegetation, grass, food waste, etc	Garden waste
	Food waste
	Biological
Visible metal, glass, ceramics, other inert material	Ferrous
	Aluminium
	Glass
Sum of two fractions: Coarse inert particles, including gravel and concrete Fine soil including gravel <10 mm	Construction waste
	Other inorganics

4.5 Ground investigation results

In-situ testing

4.5.1 Photoionisation Detector (PID) readings were undertaken during the GI, most locations within the landfill recorded a positive reading with a maximum recorded measurement of 346 ppm. Notable PID detections (above 50 ppm) are detailed in **Table 4.4 below and are shown on Figure 11.**

Table 4.4 PID readings above 50 ppm recorded during the GI

Exploratory location	Depth (mbgl)	PID Result (ppm)
BH209	10.8	94.3
BH225	0.7	50.9
BH226	6.0	73.6
BH231	3.8	271.1
	4.35	64.9
BH233	3.8	298.0
WS221	1.4	346.0
WS224	3.6	185.6
TP217	3.0	71.0
	4.5	52.3
TP220	2.5	67.0
	4.5	56.4
TP223	4.5	67.1
TP228	2.5	370.2
TP237	4.5	254.8
TP261	4.5	51.2
	5.5	78.9
TP262	5.7	51.2

Exploratory location	Depth (mbgl)	PID Result (ppm)
TP268A	4.5	55.8
	5.4	89.0
TP269	3.5	52.8
	4.5	98.2
	5.4	102.8
TP274	2.5	50.1
	3.5	72.9
	4.5	97.3
	5.4	101.3
TP275	4.5	50.2
	5.4	82.8

Visual and olfactory contamination

4.5.2 Visual and olfactory observations of contamination from the GI are detailed in **Table 4.5** and shown on **Figure 11**, with the exception of observations associated with degradation of organic waste in the landfill, which were widespread.

Table 4.5 Visual and Olfactory observations of contamination encountered during the GI

Hole ID	Observation Type	Depth (mbgl)	Description
BH208	Visual and olfactory	9.0 – 11.5	Oily sheen and hydrocarbon odour
BH223	Visual and olfactory	4.9 – 6.25	Oily sheen and faint putrid odour
BH224	Visual and olfactory	1.0 – 1.7	Oily sheen and strong musk and hydrocarbon odour
	Visual	6.0 – 7.0	Oily sheen
BH228	Visual and olfactory	7.0 – 7.5	Oily sheen and distinct putrid and hydrocarbon odour
BH231	Visual and olfactory	4.0 – 4.5	Oily sheen and strong ether and hydrocarbon odour
TP268	Visual	0.7	Barrel containing free product
WS224	Visual	4.0 - 5.0	Heavy black staining between 4.0 - 5.0mbgl and oily sheen on perched water surface

Groundwater Levels

4.5.3 Following the GI fieldwork, groundwater level monitoring was undertaken from July to October 2018 and from December 2018 to March 2019. Six rounds of monitoring were completed on each of the wells. Generally, the groundwater levels were recorded between 30 – 43m bgl beneath the

landfill. **Table 4.6** below records the monitoring results of groundwater levels within the Chalk.

Table 4.6 Groundwater levels within the Chalk during monitoring.

Hole ID	Date	Depth (m bgl)	Level (m AOD)
GW201	07/08/2018	30.64	111.01
	23/08/2018	30.6	111.05
	04/09/2018	31.12	110.53
	18/09/2018	31.70	109.96
	01/10/2018	31.86	109.79
	16/10/2018	32.13	109.52
	14/06/2019	29.22	112.43
GW202	07/08/2018	35.36	111.44
	23/08/2018	35.18	111.62
	04/09/2018	35.68	111.12
	18/09/2018	36.31	110.49
	01/10/2018	36.44	110.37
	16/10/2018	36.9	109.90
	14/06/2019	35.3	111.50
GW203	07/08/2018	41.8	110.65
	23/08/2018	41.76	110.70
	04/09/2018	42.26	110.19

	14/06/2019	44.78	108.42
GW206	14/01/2019	42.25	113.41
	21/01/2019	42.92	112.74
	07/02/2019	43.71	111.94
	18/02/2019	43.11	112.55
	05/03/2019	43.6	112.05

Hole ID	Date	Depth (m bgl)	Level (m AOD)
	21/03/2019	43.18	112.47
	14/06/2019	43.46	112.19
GW207A	15/01/2019	38.28	116.57
	05/02/2019	39.99	114.86
	07/03/2019	39.81	115.04
	21/03/2019	39.19	115.66
	14/06/2019	40.97	113.88

Leachate

4.5.4 Nine leachate monitoring wells are located within the landfill as shown on **Figure 10.** During 2018 leachate levels were monitored to assess the thickness of leachate that was being generated by the decomposition of landfill waste. The monitoring results are summarised in **Table 4.7** below.

4.5.5 Leachate is recorded to have accumulated in all installations with the exception of LF-BH07 which was dry on all monitoring visits. LW201, LW204, LF-BH06 and LF-BH12A have consistently recorded the greatest thickness of leachate (>0.9 m on average).

Table 4.7 Summary of leachate measurements

Location	Leachate thickness (m)		
	Minimum	Maximum	Mean
LW201	1.085	2.04	1.63
LW202	0	1.91	0.66
LW203	0	0.37	0.13
LW204	0.58	1.13	0.91
LW205	0.05	1.28	0.83
LF-BH06	0.9	4.22[1]	1.53
LF-BH07	0	0	0
LF-BH09	0	0.17	0.04
LF-BH12A	0.33	2.11	1.37

Note:

[1] The maximum leachate thickness recorded in LF-BH06 in December 2018 appears to be an erroneous result, on all other occasions the leachate thickness in this well ranged between 0.9m and 2m

Gas monitoring

4.5.6 Gas spot monitoring was undertaken between August to October 2018 and January to March 2019. Monitoring periods consisted of six rounds, every fortnight. In addition to the dedicated gas installations, boreholes with groundwater standpipes were included as part of the monitoring.

4.5.7 The readings were undertaken during periods of both high and low pressure (>/<1000mb). A summary of the range of gas concentrations and flow rates detected is summarised below in **Table 4.8**

Table 4.8 Summary of the range of gas concentrations and flow rates from the post fieldwork monitoring

Property	Result	Location of Max Result
Within Landfill Boundary		
Peak flow rates (l/hr)	<0.1 – 0.9	BH217
Peak Methane (% v/v)	0.1 – 80.6	WS224
Peak Carbon Dioxide (%v/v)	0.1 – 60	BH223
Minimum Oxygen (% v/v)	0 – 21.3	BWS217
Peak Hydrogen sulphide (ppm)	0 – 7	WS212
Outside Landfill Boundary		
Peak flow rates (l/hr)	<0.1 - 0.2	BBH204
Peak Methane (% v/v)	0 - 54.4	BWS211
Peak Carbon Dioxide (%v/v)	0.1 - 29.7	BWS211
Minimum Oxygen (% v/v)	0.1 - 21.5	BWS218
Peak Hydrogen sulphide (ppm)	0 - 1	BWS203
Notes: Only positive flows rates are reported in this table. Negative flow rates were encountered and are discussed further in **Section 12.**		

Soil vapours

4.5.8 Soil vapour samples were obtained from a total of 28 boreholes LF-BH12A, LF-BH10G, LF-BH08G, LF-BH05G, LF-BH03G, LF-BH04G, LF-BH09, LF-BH07, LF-BH06 and LF-BH02 (long-term monitoring wells), BH201, BH203, BH204, BH207, BH213, BH219, BH220, BH226, BWS203, BWS213, BWS2016, WS206 (WVP) and BH216, BH222, BH223, BH232, BWS217, WS224 (LTCP), which were tested in the laboratory for the following:

a. bulk gases i.e. methane, carbon dioxide, oxygen etc;
b. speciated volatile organic compounds (VOCs);
c. odorant gas analysis (hydrogen sulphide);
d. C1-C7 hydrocarbons (alkanes & alkene);

e. total petroleum hydrocarbon (TPH) in gas samples (aliphatic and aromatic C4 to C12); and

f. dioxins and furans.

4.5.9 The limit of detection varies for each determinand and between borehole samples due to dilutions needed to be conducted on the samples**. Table 4.9** below summarises the results where values above limit of detection (LOD) were recorded.

Table 4.9 Summary of soil vapour sample results

Contaminant	CAS No.	Min.	Max.	No. above LOD/ (total number of tests)
		µg/m³		
1,1,1-Trichloroethane	71-55-6	46.9	490	3
1,1,2,2-Tetrachloroethane	79-34-5	15.7	1300	6
1,1,2-Trichloroethane	79-00-5	46.5	1220	7
1,1-Dichloroethane	75-34-3	27.5	300	4
1,1-Dichloroethene+	75-35-4	27	68.8	3 (93)
1,2,3-Trimethylbenzene+	526-73-8	10.2	1020	10 (83)
1,2,4-Trichlorobenzene	120-82-1	10.5	5920	16
1,2,4-Trimethylbenzene+	95-63-6	6.91	48.7	9 (93)
1,2-Dibromoethane	106-93-4	44.8	44.8	1
1,2-Dichlorobenzene	95-50-1	9.94	45	2

5 GROUND CONDITIONS

5.1 General

5.1.1 A 3-dimensional (3D) ground model of the area to assist the understanding of the Main Application Site was developed (Ref. 3). The 3D ground model has been developed by collating information from a range of data sources, including:

a. photogrammetry data at 5 m resolution;
b. topographical survey of the site;
c. historical aerial photographs;
d. historical maps;
e. GIs undertaken at the site; and
f. forensic logging of waste material within the landfill.

5.1.2 This model has been updated to include all additional ground investigation data. The most recent version includes data from the preliminary 2016/17 investigations as well as data from the 2019 ground investigation. Cross sections showing the geology and proposed development are shown on **Figure 12 and 13.**

5.1.3 The model has been used to inform the ground conditions presented in the following sections and the risk assessments presented **in Section 10**.

5.2 Stratigraphic sequence

5.2.1 The strata encountered during the ground investigation are detailed in **Table 5.1.** The ground investigation data and Arup's model broadly confirm the published geology and previously encountered conditions from historical GIs identified in the PRA.

Table 5.1 General geology of the site

Material Name	Typical Description	Typical Thickness (m)
Topsoil	Generally stiff gravelly sandy clay. The gravel comprises flint, chalk, brick, concrete and clinker.	Average of 0.3m in 'undeveloped' areas of the Development Area.
Made Ground (General)	Typically, arisings from past airport projects, but also includes the construction of car parks etc.	Generally <1.0m but up to 6 m to the immediate south of the landfill and up to 20m beneath the proposed Airport Access Road along the Dairyborn Escarpment.
Made Ground (Landfill)	Mixed domestic, commercial and construction/demolition waste	Up to 20m

Material Name	Typical Description	Typical Thickness (m)
	deposited between the 1930s and 1980s.	
Dry Valley Deposits	Silty clay and gravel.	2m within the valley bottom
Head Deposits	Clay associated with the weathering of material in the valley sides and floor.	2m (but up to 5m in places) in the valleys
Clay-with-Flints	Highly plastic clay containing flint gravel	3m (but up to 7m in places) on the plateau occupied by the existing airport. Absent in the valley areas
Chalk	Chalk – weathered near the surface.	Full thickness not proven

5.2.2 Each stratum within the ground model and in the wider proposed development are described in more detail below:

Made Ground

5.2.3 Made Ground is generally >1m in thickness across most of the proposed development, with the exception of the following areas where significant thicknesses were encountered (**see Figure 3** for location of Areas):

a. **Area A**- the former landfill covers most of Area A, with waste up to of 20+ m above the base of the valley. The nature of the landfill material is further discussed in detail in **Section 8.**

b. **Existing Airport Land (LLAOL Contractor Compound)**- Made Ground was observed to be up to 10m in thickness within the area to the south of the landfill. This material is understood to be the arisings from previous development across the airport and is material that is being temporarily stored in this area (Ref. 16). It is understood that this fill material was imported as part of the development of the runway and levelling of the area.

c. **Airport Access Road** - significant depth of Made Ground encountered at Airport Way up to 20.0m associated with the Dairyborn escarpment. This lies directly onto the underlying chalk bedrock in places.

d. **Areas D and E**- historical mapping suggests a significant amount of fill has been imported onto Area D to form an earthwork platform; the platform was built out from the existing slope. The volume of the material deposited is estimated to be 62,000 m^3, with a maximum fill depth of 15 m. Aerial photography indicates that this fill is likely to date from the mid-1950s and is predominately chalky in nature. The origin of this material is unknown, however, the aerial photography suggests excavations were occurring in a number of areas in the vicinity of the site at the time of its deposition. In Area E, historical mapping, aerial photography and current topography suggests that

up to 10 m of fill has been placed in parts of the site. The age and origin of the material is unknown but aerial photography and historical mapping suggest it may have been placed during the 1940s.

Landfill

5.2.4 A detailed review of the records pertaining to the landfill was undertaken previously (Ref. 1) which indicated that the landfill is not as extensive as the Environment Agency boundary. The GI observed that the north-eastern extent of the agency boundary comprises of natural strata **(see Figure 3).**

5.2.5 The landfill has filled the head of the dry chalk valley and the waste thickness reflect this, with thicker areas above the base of the valley (20+ m) and the thinner deposits towards the sides (4m – 5m).

5.2.6 The history of filling was previously estimated as part of assessment work on the landfill. The estimated filling history has been updated with the recent GI data combined with the following information:

a. Photogrammetry observations of waste deposited at different periods;
b. Dates recorded on waste material during the recent GI works;
c. Observations of the nature of material from the recent GI works; and
d. Structure of the landfill developed in the ground model.

5.2.7 The estimated order and extent of filling is shown in **Figure 14** and the estimated volume placed during each era of filling is provided in **Table 5.2.**

5.2.8 Detailed discussion of the characteristics of the waste and the variation between different periods of filling is presented in **Section 8.**

Table 5.2 Volumes deposited during waste filling periods

Period of filling	Estimated volume in landfill (m^3)	Typical components of this era of filling
Pre 1947	190,000	Ash/fines, wood, metal, fabric, rubber, ceramic, brick and glass
1947 – 1955	350,000	Ash/fines, wood, metal, fabric, rubber, ceramic, brick and glass
1955 – 1960	580,000	Ash/fines, wood, metal, fabric, rubber, ceramic, brick and glass
1960-1970	520,000	Ash/fines, wood, metal, fabric, rubber, ceramic, brick and glass Later 60s waste include plastic components
1970-1980	2,500,000	Brick, tile, concrete, polystyrene, paper, plastic, cans and food waste, cardboard, metal, rubber and glass.

Period of filling	Estimated volume in landfill (m^3)	Typical components of this era of filling
Post 1980	150,000	Non-landfill material. Fill material placed post closure of landfill on LTCP area to create a suitable surface for use as a car park.
Total	**4,400,000**	

5.2.9 Further detailed description of the waste types encountered within the landfill is provided in **Section 8**.

5.3 Superficial deposits

5.3.1 The distinction between of Clay-with-Flints, Head and Dry Valley Deposits has been made both by examining ground investigation logs and an understanding of where each of these materials should be present. Clay-with-Flints would have covered the entire development area, however the incision of the valley into the chalk would have eroded these deposits completely from the valley floor. Weathering of the remaining Clay-with-Flints on the valley sides resulted in Head deposits with some of this material eroding and deposited at the valley floor, forming Dry Valley Deposits. Further description of the superficial deposits is provided below.

Dry Valley Deposits

5.3.2 These deposits have been mapped by the BGS and are anticipated to be present in the valley floor throughout the proposed development.

5.3.3 These deposits are formed by a combination of processes including the weathering of the chalk bedrock under periglacial conditions, input of material supplied from the valley sides by solifluction and a degree of fluvial reworking by surface water.

5.3.4 The Dry Valley Deposits are typically described as firm to stiff (occasionally soft) light brown, dark brown, orangish brown, reddish brown or greyish brown slightly sandy, slightly gravelly clay. Rarely it is present as: sandy, slightly gravelly, clayey silt; very clayey, very sandy gravel; or slightly silty, slightly gravelly sand. The gravel is recorded as flint and occasionally chalk and subangular to subrounded cobbles of flint are frequently present

5.3.5 The 2016 ground investigations(Ref. 6)(Ref. 7)(Ref. 8)(Ref. 9) confirmed their presence within the valley bottom in Area B, between 0.7m and 2.1m thick.

Head

5.3.6 Head is present on the valley sides of the two dry valleys present within the development area.

5.3.7 The Head is typically described as firm to very stiff (occasionally soft) light brown, dark brown, orangish brown, reddish brown or greyish brown

slightly sandy, slightly gravelly clay. Rarely it is present as slightly sandy, slightly gravelly, clayey silt. The gravel is recorded as flint and chalk (occasionally chert). Subangular to subrounded cobbles of flint are frequently present.

Clay-with-flints

5.3.8 This formation overlies the chalk group and is a residual soil formed by the solution weathering of the chalk. The Clay-with-Flint Formation comprises stiff reddish brown slightly sandy gravelly clay with a medium cobble content. The gravel is angular to rounded and comprises flint gravel and occasional chalk.

5.3.9 The Clay-with-Flints varies in thickness across the development area. It is mainly present on the plateau (typically 3-5 m in thickness) and valley sides however is absent from the base of the valley. Previous GI has indicated it is typically 3.7 m thick across the Proposed Development area but has been recorded up to 15 m thick. This reflects the irregular dissolution contact between the Clay-with-Flints and the Chalk group. The GI completed along the proposed Airport Access Road alignment recorded Clay-with-Flints beneath the Made Ground from 0.5m bgl up to 7.45m bgl beneath the industrial areas on the Existing Airport Land but is generally absent at the western extent along the Dairyborn Escarpment where there is a greater depth of Made Ground.

5.4 Chalk

5.4.1 The bedrock beneath the proposed development consists of Cretaceous Chalk (undifferentiated Lewes Nodular and Seaford Chalk formations). These are classified as being part of the “Upper Chalk” and are composed of firm and hard chalk strata with common nodular and tabular flints and hardgrounds.

5.4.2 These in turn are underlain by the Holywell Nodular and New Pit Chalk formations, part of the “Middle Chalk” which outcrop within the dry valleys. These are generally similar in composition to the Upper Chalk formations but are generally flintless.

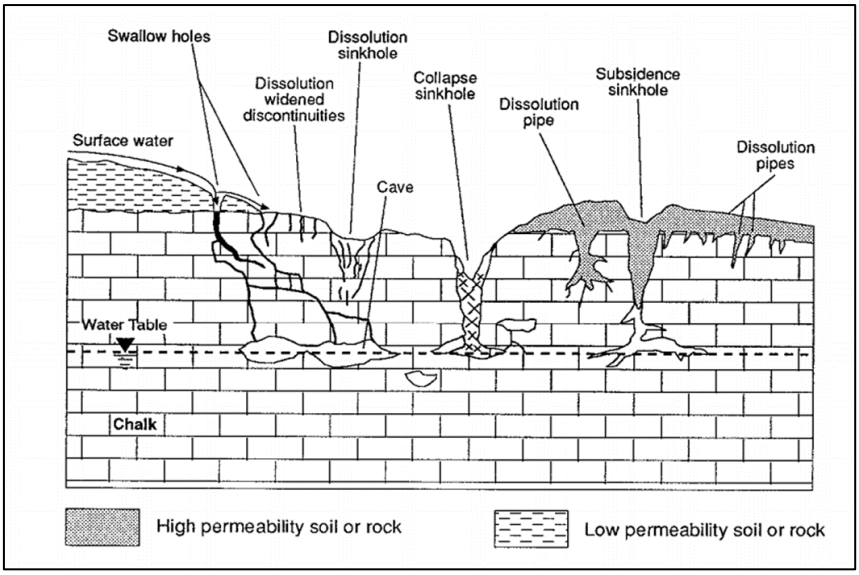
5.4.3 The Chalk is unusual compared to many other limestones, due to its almost entirely biogenic origin. In general, the Chalk is extremely fine grained (<10µm), soft and micritic. Coccoliths and other microfossils such as foraminifera and calcispheres make up a notable quantity of the matrix.

5.4.4 The condition of the chalk encountered during the GI beneath the Proposed Development area is variable. GI undertaken in Areas A, B and the Airport Access Road indicated that the upper levels of the chalk was heavily weathered and it was generally recovered as structureless sandy very silty gravel or sandy gravelly silt (Grade Dm). The depth of weathering is variable with different grades of chalk present up to Grade A at depth. This was generally present as very weak low or medium density white chalk.

5.5 Solution features

5.5.1 Solution features are formed by the dissolution of the Chalk as a result of chemical weathering. These features are present at the interface between the Clay-with-Flints formation and the Chalk. As such, these are predominately present where Clay-with-Flints formation is present such as the plateau and valley side but less frequent in the base of the valley. The types of solution features which can be encountered are shown in **Drawing** 2.

Drawing 2 Schematic illustration of common dissolution types (based on Applied Geology, 1993(Ref. 17) as cited in CIRIA C574 (Ref. 18).



5.5.2 It is difficult to detect solution features via ground investigation, as they are discrete features. Site investigation and observations from local construction projects suggest that fretting is a ubiquitous feature of the top of the chalk and that pipes features, like those exposed by the Direct Air to Rail Transit (DART) excavations, are frequent as shown in **Photograph 2.**

Photograph 2 Left: Irregular fretting of the top of the chalk in an excavation for DART Right: Possible solution features noted during DART excavation works

5.5.3 It is also likely that sinkholes of the type illustrated in **Drawing 2** are present in the area. The GI undertaken did not find any evidence of sinkholes but solution pipes and infilled fissures were found to be present beneath Area A (former landfill) and Area B. These features are important when considering potential pathways for contaminants to the groundwater, however they are difficult to detect through ground investigation and predict in terms of both location and frequency.

6 HYDROGEOLOGICAL CONDITIONS

6.1.1 A detailed review of the hydrogeological conditions beneath the site, has been undertaken (areas within the Mimram catchment) and is provided in the following report:

- Luton Rising (2021) Hydrogeological Characterisation. LLADCO-3B-ARP-00-00-RP-CG-0001 (Ref. 19)

6.1.2 The following sections are a summary of the information provided within the report.

6.2 Regional

6.2.1 The main water bearing strata in the region is the Chalk which is a dual-porosity aquifer where the matrix provides the storage and the fractures provide permeable pathways (Ref. 20). Most of the flow in the Chalk in the area is likely to occur in a few dilated fractures, typically occurring at or within a few tens of metres of the water table through dissolution enhanced features. However, it is often influenced by the presence of solution features in the chalk which can lead to interlinkages between groundwater catchments (Ref. 21).

6.2.2 The regional groundwater flow within the Chalk is predominantly towards the southeast in the dip direction of the Chalk. The main area of groundwater recharge is the Chiltern Hills along the northern boundary of the area where the escarpment forms a major groundwater divide (Ref. 20). The regional flow system is likely to be locally influenced by abstraction of groundwater from the aquifer, the nearest potable water supply borehole is located at King's Walden approximately 1.5km northeast of the Main Application Site (2.8 km northeast of the landfill boundary).

6.2.3 There are two main water body catchments which cover the Luton area; the Lee and the Mimram catchments. The former landfill (Area A) lies in the Mimram catchment and there is a groundwater divide to the west, where Luton Airport lies in the Lee catchment. Groundwater flow direction in the Lee catchment is influenced by local abstraction and flows in a westerly direction. Abstractions are identified on **Figure 7,** in the Lee Catchment these are generally for industrial use and clustered around the former Vauxhall Motor Works, two private water supplies are located south of the River Lee, a second potable supply operated by Affinity Water and a supply for commercial and domestic purposes. The groundwater flow in the Mimram catchment is affected by the potable abstraction near Kings Walden (Ref. 20) and a second potable water abstraction (Nine Wells) at Whitwell, east of the former landfill. Both may create a more easterly flow direction than the south easterly regional flow.

6.2.4 Two private water supplies are located east of the site. The abstractions are located approximately 1.5km northeast and 1.2km south east of the

Main Application Site (2.7km northeast and 2.6km south east of the landfill boundary) within the Mimram catchment, see **Figure 7.**

6.3 Groundwater levels and flow

Observed levels

6.3.1 Groundwater levels in the chalk within the Mimram catchment (underlying Area A-Former Landfill) have been measured in the boreholes installed during the most recent GIs. Recorded groundwater elevations have been contoured and are shown in Figure 15. The groundwater elevations beneath the landfill are typically 112m AOD (40m bgl) and range between 17.5m to 36m below the base of the landfill.

6.3.2 The highest groundwater level recorded beneath the site was in June 2018 at 124.46m AOD at LF-BH05 located to the southwest of the landfill. This is consistently higher than the levels recorded beneath the remainder of the landfill. It is possible that the groundwater levels in this borehole are being influenced by the presence of a nearby soakaway in the airport (the Central Soakaway) which is artificially increasing water levels in this borehole.

6.3.3 There are several soakaways present on-site within the existing airport, see **Figure 8** for locations. These are expected to cause local increases in groundwater levels, however are unlikely to directly influence the location of the main groundwater divide in the area.

6.3.4 The groundwater surface is lower in the south east of the main application area beneath the base of the valley floor, at approximately 106m AOD (14m below the level of the valley floor).

6.3.5 Groundwater levels within the Lee Catchment have been recorded as part of post fieldwork monitoring for the DART (Ref. 22). The monitoring data indicates groundwater levels to be around 110m AOD beneath the Existing Airport Land, (42m bgl) and dropping to 99m AOD beneath the Parkway Station and western end of Airport Way, approximately 39m bgl and 12m bgl respectively. The groundwater is much shallower at the Parkway Station due to the fall in ground levels to the southwest of the airport.

6.3.6 Based on these groundwater levels, the groundwater flow direction close to the former landfill is generally east-northeast, with a flow divide located to the south and west of the landfill site beyond which groundwater flows in a southwesterly direction beneath the main airport toward the River Lee.

6.3.7 The observed levels and flow direction correlate with the assumption that the flow system near the site is locally modified by abstraction of groundwater from the Chalk aquifer. The nearest potable water supply borehole is located approximately 2.8km northeast from the landfill at Kings Walden. A second potable water abstraction (Nine Wells) is located at Whitwell, approximately 4.5km east of the Main Application Site and

5.3km east of the former landfill. Both appear to be influencing a more easterly flow direction than the anticipated southeasterly regional flow.

Seasonal variability

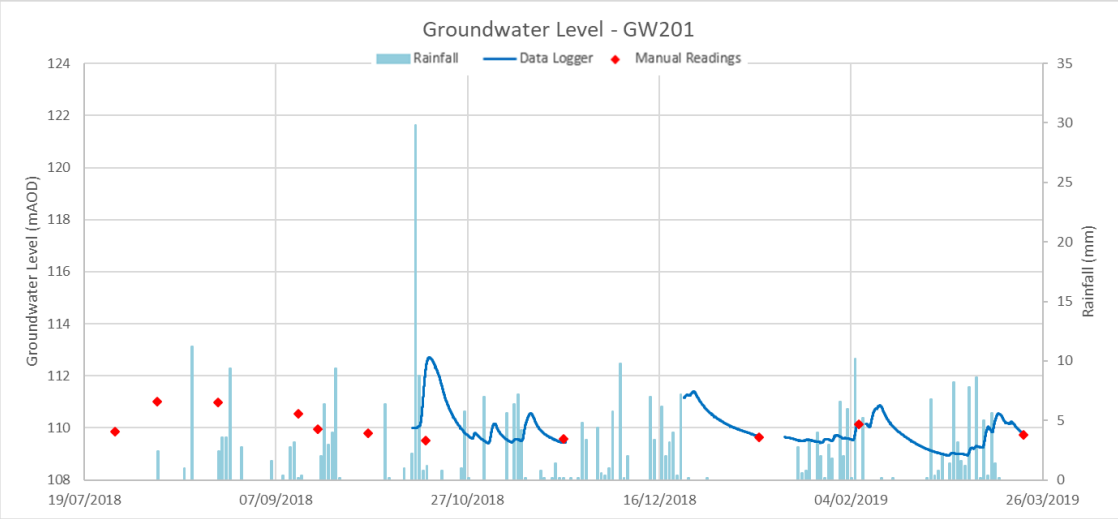
6.3.8 The groundwater levels recorded to date indicate that the valley that the former landfill lies within is dry, with no seasonal emergences. The numerous site walkovers undertaken in the area support this and no indications of any emergence of groundwater in the base of the valley have been observed e.g. marshy areas. The nearest point at which groundwater is known to emerge is at the River Mimram, northwest of Whitwell, approximately 4km to the southeast of the site.

6.3.9 Because there are no surface water features in the vicinity of the site the recharge to the underlying Chalk aquifer is almost entirely from infiltration of precipitation, either naturally through soils in the undeveloped areas, or more focused through several on-site engineered infiltration basins.

6.3.10 The anticipated low permeability of the Clay-with-Flints deposit, as well as hardstanding areas associated with the existing airport, may limit rainfall infiltration and therefore recharge to the underlying Chalk aquifer. Recharge is likely to occur to the Chalk aquifer where there is an absence of these low permeability deposits, such as where the Chalk is exposed in the dry valleys.

6.3.11 Observed groundwater levels show a seasonal response to rainfall. Groundwater levels recorded by data loggers installed on the Main Application site during 2018 show a relatively rapid response in groundwater levels following a high rainfall event as shown in **Drawing 3.**

Drawing 3 Groundwater levels recorded in GW201 compared to rainfall



6.3.12 The groundwater levels recorded below the landfill from January 2018 to December 2018 show a maximum seasonal variation of 10.94m, this was observed in borehole LF-BH04 between January and June 2018. This is due to a high groundwater level reading taken in June 2018 that is dissimilar to all other readings at this location and is considered to be

anomalous. The next highest seasonal variation observed is 7.6m within LF-BH05.

6.3.13 Larger seasonal and year-to-year variations in groundwater levels were observed beneath the landfill area than within the dry valley (part of the Century Park development ground investigation). Within the dry valley, most of the boreholes display a seasonal variation, between January and December 2018, of less than 5m. The largest seasonal groundwater variation recorded was 5.22m in CP-BH24. Though, due to the lower topographical elevation within the dry valley, groundwater levels are closer to surface (15m bgl to 35m bgl). This variation of fluctuation related to topography is common in the Chalk aquifer.

6.3.14 The variability in groundwater levels recorded during 2018 supports outputs from the Environment Agency's Hertfordshire Chalk regional groundwater model, suggesting that the likely seasonal range in groundwater levels is approximately 5m to 10m in the vicinity of the landfill, and up to a maximum 5 m variation within the dry valleys. The minimum and maximum groundwater levels recorded in May 2017 and June 2018 are contoured in **Figure 15.**

6.3.15 The majority of the groundwater monitoring completed within the Main Application Site is of limited duration and provides a short-term, non-continuous dataset of the groundwater levels and as such is unlikely to recorded extreme minimum and maximum groundwater events. A detailed assessment of potential maximum groundwater levels which might be expected to occur on site has been undertaken and is reported separately (19) The report concluded that absolute maximum groundwater levels are expected to range from 134m AOD in the centre of the groundwater divide, west of the landfill, to 116m AOD in the east of the proposed development area.

6.4 Aquifer properties

6.4.1 The Chalk is confined in some areas of the site by low permeability deposits such as the Clay-with-Flints and Head Deposits. Rainfall infiltration and recharge into the underlying Chalk aquifer may be limited in these areas (Ref. 21). As a result, the background chemistry between areas of confined and unconfined Chalk varies. In addition, areas where the Chalk aquifer is unconfined are more susceptible to pollution, in particular diffuse pollution from agricultural or domestic sources (Ref. 21).

6.4.2 The ability of groundwater to flow (transmissivity) within chalk is complex and is heavily influenced by the presence and geometry of fractures. Literature has noted the following important features of the fractures which affect the hydraulic properties of the chalk (Ref. 23).

a. The fracture density is generally thought to peak at about 20 mbgl; productive fractures decrease with depth. It is generally accepted that productive fractures are restricted to the upper few tens of metres of the aquifer (circa 50m).

o. Fractures are both horizontal and vertical.

p. The fractures can be termed primary and secondary fissures. Primary are the ubiquitous narrow fractures which have a typical hydraulic conductivity of the order of 0.1 m/d (1.2 x10^{-6}m/s) and contribute a transmissivity of 20m^2/d to the aquifer. The secondary fractures are the solution enlarged fractures and they contribute the remaining transmissivity of the aquifer, often more than 1000m^2/d. The transmissivity of the matrix is generally negligible.

q. The matrix of the chalk does not contribute directly to the permeability, but it has an important role in providing water to the fractures.

r. The areas of highest transmissivity generally tend to be beneath valleys, with the highest values in the unconfined chalk.

s. Aquifer properties are also strongly controlled by lithology, with hard bands of chalk rock having increased permeability as a result of associated fracturing.

t. It is further complicated by the weathered top of the chalk, which is often referred to as 'putty chalk', where the chalk is structureless and forms a clayey silt. This material can have significantly lower hydraulic conductivity reducing the transmissivity of the aquifer. The travel time within the putty chalk horizon is estimated to be between 2-15 times slower than in the main Chalk (British Geological Survey (1995)).

6.4.3 Packer testing was undertaken as part of the 2018 GI to inform the permeability of the Chalk aquifer beneath the site. Packer testing was undertaken at regular intervals in the Chalk strata in seven boreholes (GW201-GW206 inclusive and GW207a). The permeability results were variable with some tests displaying behaviour characteristic of a high conductivity system. These higher values are likely to be a result of interception of low frequency but high permeability fractures.

6.4.4 The packer test data has been separated in to 20m intervals from below the top of chalk to observe the variation in hydraulic properties with depth, the averages for each interval are shown in **Table 6.1.**

Table 6.1 Hydraulic conductivity with depth from top of Chalk

Depth from top of Chalk (m)	Mean hydraulic conductivity (m/s)	Geometric mean hydraulic conductivity (m/s)
0 – 20	2.37 x 10^{-5}	1.30 x 10^{-6}
20 – 30	8.04 x 10^{-6}	3.65 x 10^{-6}
30 - 40	6.00 x 10^{-6}	7.00 x 10^{-7}
40 – 52	3.36 x 10^{-7}	2.38 x 10^{-7}

6.4.5 The results of the packer tests indicate a decrease in hydraulic conductivity with depth, with the higher conductivities likely to be associated with the secondary fissures formed from dissolution around the water table fluctuations within the top 20m of the Chalk.

6.5 Background groundwater quality

6.5.1 The background chemical quality of groundwater in the vicinity of Luton is known to be poor because of a “low level halo” of solvent contamination due to the long history of industrial sites in the area. Published information indicates no single source of the pollution has been identified and it was attributed to widespread diffuse pollution with some ‘hotspots’ of high concentrations. Clean up of the aquifer was not considered a practical option and therefore treatment of the groundwater at abstraction points was adopted instead (Ref. 24).

6.5.2 A baseline report is available for the Chalk of the Colne and Lee river catchments as well as information on the contamination of the Chalk aquifer by chlorinated solvents (Ref. 24). This report indicates that a wide variety of contaminants including nitrate, ammonia, pesticides, bromate, hydrocarbons and solvents have been detected in the Chalk between the River Colne and the River Lee. The data in the report is for the Lee catchment, however there may be interlinkages between the catchments through solution features as discussed above and as such, may also be relevant for the Mimram catchment.

6.5.3 A comparison of literature values for groundwater quality for selected determinants within the Lee catchment are summarised in **Table 6.2**. The data is compared to groundwater quality data obtained from groundwater wells installed within the Chalk across the Airport which lies within the Lee catchment, these samples were obtained during ground investigations completed in 2016 and 2017. Background groundwater quality from the Mimram catchment obtained during the 2018 GI from two wells installed up-hydraulic gradient of the landfill (GW201 and GW202) is also summarised.

Table 6.2 Comparison of typical background concentrations of determinants in groundwater in the aquifer in the Luton area to site monitoring data for the Lee and Mimram catchments

Determinand	Units	Literature Values		Groundwater samples			
		Lee catchment		Lee catchment		Mimram catchment (up-gradient of landfill)	
		Min	Max	Min	Max	Min	Max
Calcium	mg/l	17	205	71	208	106	119
Magnesium	mg/l	1.7	113	2.2	8.7	2.42	4.07
Sodium	mg/l	6	589	7	83	40.3	51

Determinand	Units	Literature Values		Groundwater samples			
		Lee catchment		Lee catchment		Mimram catchment (up-gradient of landfill)	
		Min	Max	Min	Max	Min	Max
Potassium	mg/l	0.8	28.5	<1	6	1.44	4.63
Chloride	mg/l	14	1,250	12	122.86	62.3	108
Sulphate	mg/l	5	562	13.1	173	11.6	33.6
Nitrate	mg/l	<0.01	11.2	<0.07	21.9	<0.07	1.18
Nitrite	mg/l	<0.001	0.053	<.03	0.49	<0.02	0.27
Ammoniacal nitrogen	mg/l	<0.003	1.66	<0.015	0.3	<2	0.433
Arsenic	µg/l	<1	5	<0.15	2.52	0.586	6.68
Boron	µg/l	<100	600	<10	100	10.9	40
Barium	µg/l	25	93.6	35	100	60	89.7
Cadmium	µg/l	<0.05	0.35	<0.02	0.02	<0.08	<0.08
Chromium	µg/l	<0.5	3	<0.2	35	<1	10.8
Copper	µg/l	0.4	37.1	<1	17	<0.3	1.6
Iron	µg/l	<5	1280	5	1,900	<19	584
Mercury	µg/l	<0.1	0.7	<0.01	0.07	<0.01	0.0144
Manganese	µg/l	<2	40	0.4	300	117	641
Molybdenum	µg/l	<0.1	3.5	<0.05	1.1	<3	8.17
Nickel	µg/l	<0.2	78	<0.1	44	2.19	4.11
Lead	µg/l	<0.4	1.7	<0.2	1.1	<0.2	0.344
Antimony	µg/l	<0.05	1	0.7	15	<1	<1
Zinc	µg/l	<2	298	<1	18	1.33	23.6
Tetrachloroethene (TCE)	µg/l	1.12	631	<1	3	<1	<1
1,1,1-trichloroethane (TCA)	µg/l	5.5	1,020	<1	4	<1	<1
Tetrachloroethene (PCE)	µg/l	1.7	206	<1	4	<1	<1

6.5.4 In general, the concentrations recorded within both the Lee and Mimram catchments are similar to the literature values. Concentrations of chromium and manganese are elevated in wells within both catchments compared to literature values suggesting that there has been some impact on the aquifer from either on or off-site sources.

6.5.5 Low concentrations of solvents have been recorded in the groundwater within the Lee catchment and may be a result of the low-level halo of contamination across the wider Luton area. Solvent concentrations within the wells in the Mimram catchment were below the laboratory limit of detection, suggesting that there may be limited connectivity between

groundwater in the two catchments, although this cannot be completely ruled out.

6.6 Kings Walden abstraction groundwater quality

6.6.1 Groundwater quality data for the Kings Walden potable water supply abstraction (approximately 2.8km northeast of the Main Application site) was obtained from the Environment Agency which covered the period from November 1992 to September 2018.

6.6.2 A limited number of determinands are routinely monitored at the abstraction (pH, conductivity, ammoniacal nitrogen, nitrate and nitrite). Concentrations of nitrate are elevated (average of 11mg/l) when compared to the background groundwater quality data obtained from the on-site monitoring wells and are likely to be reflective of agricultural land use in the area surrounding the abstraction. No ammoniacal nitrogen, which is a common indicator of landfill leachate, is present in the groundwater at Kings Walden.

6.6.3 Limited samples of groundwater from the abstraction have been analysed for other contaminants including metals, hydrocarbons and solvents. The concentrations of these contaminants indicated that they are either absent or within the normal background groundwater quality range expected in the Chalk.

7 GROUND MODEL

7.1.1 The ground model is key to understanding the overall fate and transport of potential contaminants from the landfill. A 3D ground model was developed as part of the assessment as described in **Section 5.1.** This model has been used to inform the ground and hydrogeological features pertinent to the risk assessment. Key features of the ground model are:

a. The area is characterised by a series of dry valleys. The former landfill fills part of the head of one of the dry valleys.

b. The surface of the former landfill is undulating with an elevation between 150m AOD and 155m AOD with the southern part being particularly uneven and the ground level to the south and east dropping off steeply. The elevation at the bottom of the dry valley adjacent to the landfill is approximately 130m AOD.

c. Clay-with-Flints would have originally covered the area, but when the valleys were incised into the chalk this removed these deposits from the base of the valleys. Head deposits were formed on the valley sides through weathering of the Clay-with-Flints deposits, leaving only Head present on the valley sides. Some of this material eroded and was deposited in the bottom of the valleys, forming Dry Valley Deposits in the base of the valleys.

d. The ground model suggests that there may be discontinuous clay superficial deposits present beneath the landfill site which, where present, would retard the downward migration of leachate.

e. The strata underlying the Airport Access Road (off the landfill), varies, a significant depth of Made Ground (up to 20m) has been recorded directly onto weathered chalk along the Dairyborn escarpment, a thin band of Made Ground onto Chalk with Flints up to 7.0m thickness over weathered chalk is noted beneath the sections running through the Existing Airport Land.

f. The detailed GI found no consistent basal liner or engineered cap which confirms that the site is an old ‘dilute and disperse’ landfill.

g. The waste was noted to be relatively dry during the GI and this is supported by limited amount of leachate which collected within the leachate wells. This suggests that the infiltration is percolating through and is not retained by the landfill.

h. Monitoring suggests that the groundwater flows generally to the east beneath the side and generally it lies at least 15 m below the lowest part of the landfill.

i. Solution features were noted beneath the landfill during the GI, most commonly there were an irregular fretting of the top of the chalk, and solution pipes that extend further into the chalk. These features contain a mixture of deposits from sandy to clayey material. The features may contain more permeable deposits may provide a more

rapid route of transport of contaminants to the underlying groundwater.

j. The top of the chalk is weathered, which is often referred to as putty chalk, where the chalk is structureless and forms a clayey silt. This material can have significantly lower hydraulic conductivity reducing the transmissivity of the aquifer. The weathered chalk may retard the downward migration of leachate downwards.

k. Typically, hydraulic conductivity reduces with depth, with the higher conductivities likely to be associated with the secondary fissures that may have been enlarged by dissolution around the water table fluctuations within the top 20m of the Chalk.

l. The regional flow system in the Mimram catchment is likely to be locally modified by abstraction of groundwater from two potable absrtactions hwhich have modified flow direction to the east rather than south east.

m. Groundwater flow in the Lee Catchment beneath the Airport Access Road is to the south west toward the River Lee.

8 AREA A- LANDFILL WASTE CHARACTERISTICS

8.1 Methodology

8.1.1 Following the waste forensics assessment, as detailed in **Section 4.4**. a review of the investigation location logs, site photographs and site notes, each sample was assigned a waste type in accordance with the seven main waste types summarised in **Table 8.1**. The same process was also undertaken for the exploratory logs to assign the predominate waste type to each waste strata encountered. A total of 1,239 strata description were assessed.

8.1.2 The detailed methodology for assigning waste types is presented in **Appendix D.** This process was subjective and therefore the potential for bias exists. To ensure the results were representative a number of checks were undertaken on the data, these are detailed in **Appendix D.** In addition, a proportion of the forensic samples were sent off for laboratory analysis. Good correlations were found between the fraction of each waste component measured in the samples under laboratory conditions and the results obtained in the field laboratory.

Table 8.1 Categorisation of waste types

Waste Type	Overall description	Criteria for determining waste type	Representative example of waste type
Non-Chalky Cover	Cover material with a non-chalky matrix	The Non-Chalky Cover is largely derived from superficial deposits such as Clay-with-Flints Formation or Dry Valley Deposits. Generally described as brown or orangish brown, containing flint and occasionally chalk gravel. The majority of this waste type are natural materials (other non-organics) mostly soil with some inclusions of construction waste. Small proportions of other waste constituents may also be present within these layers, generally presumed to be from tracking materials whilst being placed.	
Chalky Cover	Cover material with a chalky matrix	The Chalky Cover is largely derived from Chalk. It is generally described as white, off-white or grey in colour and containing chalk and more occasionally flint gravel. Comprises mostly of natural materials (other non-organics), mostly soil with some inclusions of construction waste. Small proportions of other waste constituents may also be present within these layers, generally presumed to be from tracking materials whilst being placed.	

Waste Type	Overall description	Criteria for determining waste type	Representative example of waste type
Old Domestic	Household waste from pre-1970	Old Domestic waste typically comprised of ashy household waste, including newspaper, leather, bones, etc. Where dates where identified in the waste (e.g. on newspapers or food containers), this was used to separate the Old Domestic Waste from the Recent Domestic Waste. Where no dates were identified a combination of the types of items within the stratum and an assessment of the composition of the strata above and below were considered.	
Recent Domestic	Household waste from post-1970	Recent Domestic waste typically, brown to dark grey in colour and largely comprising ‘black plastic bag’ waste from household bins, mixed with other materials such as materials from domestic skips and characterised by the presence of plastic, newspaper and food containers. Where dates where identified in the waste (e.g. on newspapers or food containers), this was used to separate the Recent Domestic Waste from the Old Domestic Waste. Where no dates were identified a combination of the types of items within the stratum and an assessment of the composition of the strata above and below were considered.	

Waste Type	Overall description	Criteria for determining waste type	Representative example of waste type
Commercial	Office and retail waste	Commercial Waste typically comprised of office, school or retail waste from shops or the airport. Characterised by typically greater amounts of mixed paper, newsprint, corrugated, plastic and wood in the form of pallets.	
Industrial	Waste arising from factories, scrapyards, etc	Industrial Waste largely comprised of waste from local factories, garages and the former scrapyard located in the northwest of the landfill. This waste type spans the history of waste deposition into the landfill and is therefore varied in composition. Earlier Industrial Waste typically contains more construction waste, ash, clinker and slag than the later industrial waste of the 1960s and 1970s.	

Waste Type	Overall description	Criteria for determining waste type	Representative example of waste type
Construction	Material from construction projects	Construction waste was typically encountered near surface as a 'cover' layer but was also present throughout the landfill including at significant depths. Largely derived from reworked natural superficial deposits and described as brown or orangish brown in colour. This waste type is defined by the presence of brick and concrete with a lesser percentage of wood, plastic, glass, ferrous and other organics. Occasionally, brick and concrete may be absent, but other typifying waste items are present	

8.2 Results

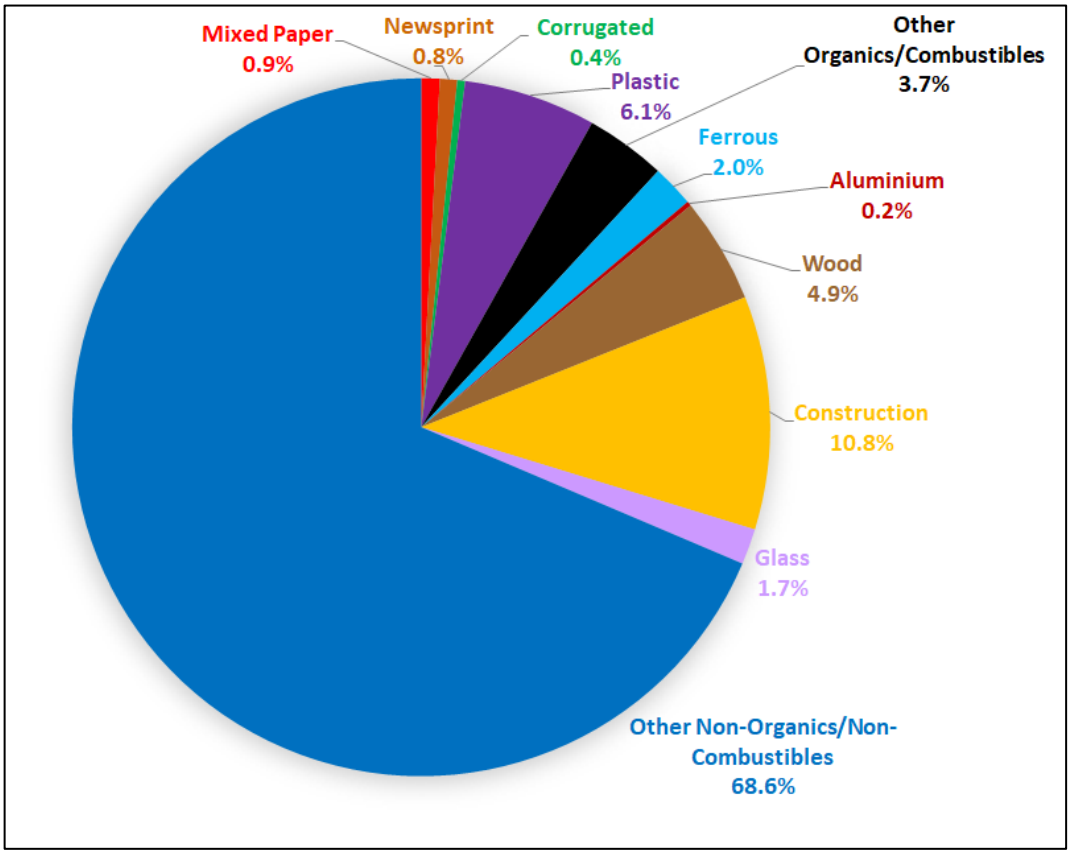
Overall waste composition

8.2.1 Understanding the overall components of the material in the landfill is important to the understanding of its current and future potential to produce leachate and landfill gas.

8.2.2 The forensic analysis of the waste provided a good estimate of the total proportions of different waste types within the landfill. As detailed in **Section 4.4** each waste component was weighed during the analysis, therefore the average percentage volume of each waste component can be calculated. **Drawing 4** shows the calculated overall percentages of the waste components.

8.2.3 The overall waste composition was found to be predominately (68%) other 'non-organics' which was defined as rock, sand, dirt, ceramics, non-ferrous metals (copper, brass etc), bones, ash, clinker and slag (see **Appendix D** logging protocol).

Drawing 4 Waste components presented as average volume percent in the landfill.



Age of waste

8.2.4 The age of the waste was estimated using the forensic analysis and observations of dates during GI works. These observations were

incorporated into the ground model developed **(see Section 5**). The model indicated that the major period of filling was during the 1970s (**see Table 5.2).**

8.2.5 The composition of the waste has changed over time reflecting the change in societal and economic growth in the UK. These trends can also be seen in the composition of the waste at the former Eaton Green landfill. The following trends can be seen in the composition of the waste:

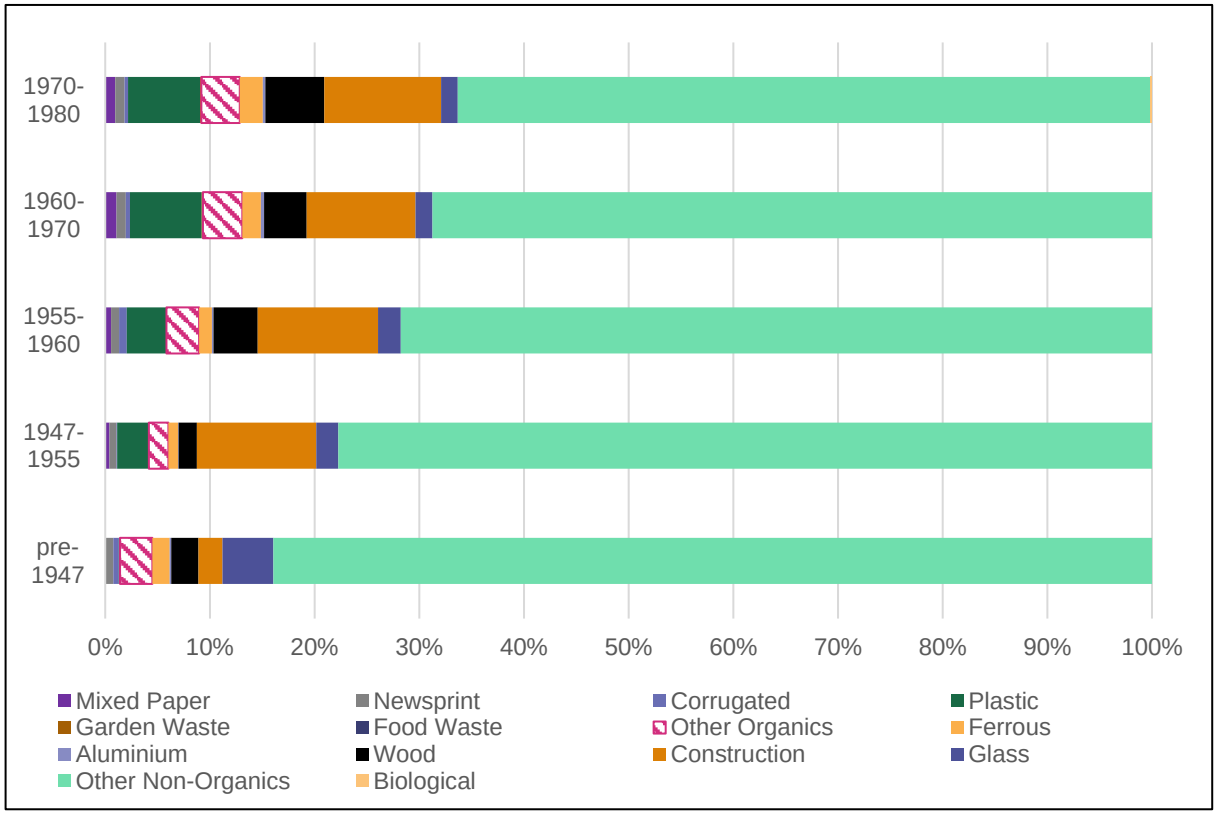
a. Prior to and during World War II very little waste was disposed of by household and industries, most by-products had a use and waste was collected for reuse and recycling i.e. rag-and-bone men (Ref. 25). This is illustrated **in Table 5.2** by the relatively low volumes of material disposed during this period;

a. There were also major changes in the composition of household waste as appliances replaced open fires for cooking, heating and water heading. Less paper and other waste was burnt on fires as appliances became more affordable (Ref. 25). The principal component of the pre-1947 waste at the former Eaton Green landfill is other non-organics material, which is likely to reflect waste of this era mainly comprising of household ash material. In addition, prior to 1950s a lot of waste was taken to ‘destructors’ by Local Authorities where waste was incinerated. The residue from these destructors also ended up in landfill (Ref. 26). The introduction of the Clean Air Act in 1957 led to a shift from incineration to disposal in landfills;

b. After World War II the 1950s were a period of economic growth and there was a big increase in carboard, plastic and glass waste which was due to a change in shopping habits towards the ‘self-service shop’ which meant every product had to be packaged. This can clearly be observed in the composition of the waste in **Drawing 5,** where there is a marked increase in the proportion of plastic, glass and paper derived materials; and

c. In all ages of waste there is a high component of either cover material or non-organic material. There is likely to be a lot of cover material present as even prior to the introduction of regulations on disposal of material to landfill, there was a requirement for ‘controlled tipping’ which required a covering of all waste within 72 hours and a minimum of 9 inches of final cover material (Ref. 25).

Drawing 5 Composition of waste by era



Waste types

8.2.6 An assessment of the waste was carried out as described in **Section 8.1,** supporting information is presented in **Appendix D.**

8.2.7 The overall percentage of different waste types by average volume in the landfill is present in **Table 8.2**. A large portion of the waste is categorised as construction (36 vol.%) or cover material (27 vol.%).

Table 8.2 Total percentage and estimated volumes of different waste types within the landfill

Waste Type	% volume	Estimated volume (m^3)
General Made Ground*	2%	85,000
Commercial	3%	130,000
Old Domestic	4%	170,000
Recent Domestic	10%	440,000
Chalky cover material	11%	485,000
Industrial	18%	790,000
Non-chalky cover material	16%	700,000
Construction	36%	1,600,000
	Total	4,400,000

Notes: Estimated total volume of material in the landfill is based on volumes calculated from the ground model (see **Section 5**).
* General Made Ground is material within the landfill not material placed post filing.

8.2.8 **Drawing 6** indicates that the distribution of waste types by era of filling. The following observations can be made:

a. there is a logical pattern demonstrated, with greatest proportion of old domestic waste in the pre-1955 waste and highest proportion of recent domestic waste in the post 1970s filling period. This supports the assessment work undertaken;

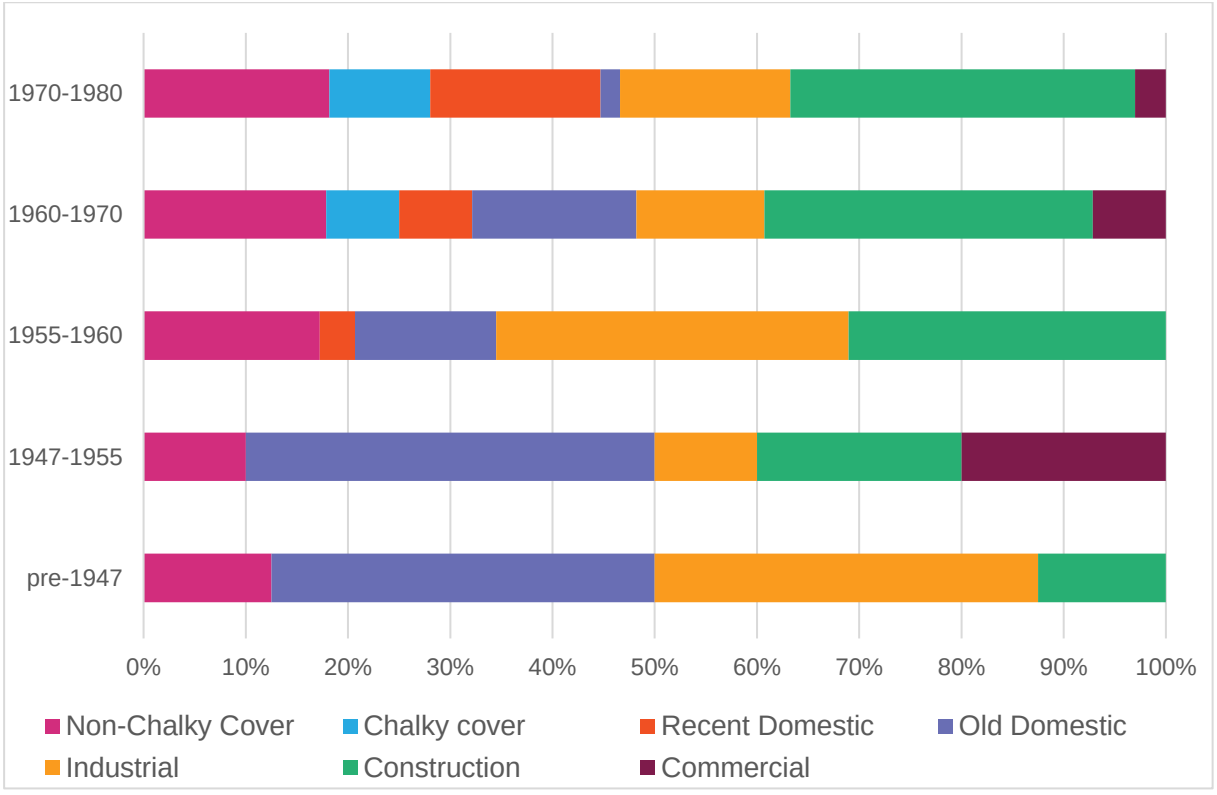
b. chalky cover material does not appear to have been used pre-1970;

c. the proportion of construction material is highest in the most recent waste post-1970s waste;

d. proportion of industrial waste appears to be highest in the older (pre-1960 waste). This may be due to difficulties distinguishing between ashy industrial and old domestic household ash waste; and

e. the proportion of cover material used appears to have increased from the 1960s onwards.

Drawing 6 Waste type by eras of filling



Chemical composition

8.2.9 The chemistry of the waste types has been examined to determine whether there are any patterns. The full analysis is presented in **Appendix D.** The following general observations in chemistry were noted:

a. The old domestic waste generally had higher concentrations of heavy metals than other waste types **(Drawing 7);**

b. There was no clear trend shown with the organic contaminants. However, generally industrial, construction and recent domestic had higher concentrations than the other waste types **(Drawing 7);**

c. Asbestos was detected most frequently and at the highest quantities in the industrial waste **(see Table 8.3**), further assessment of the asbestos encountered is provided in **Section 10.3.**

Drawing 7 Concentrations of arsenic (top left), mercury (top right), benzene (bottom left) and Naphthalene (bottom right) by waste type. Concentrations in mg/kg

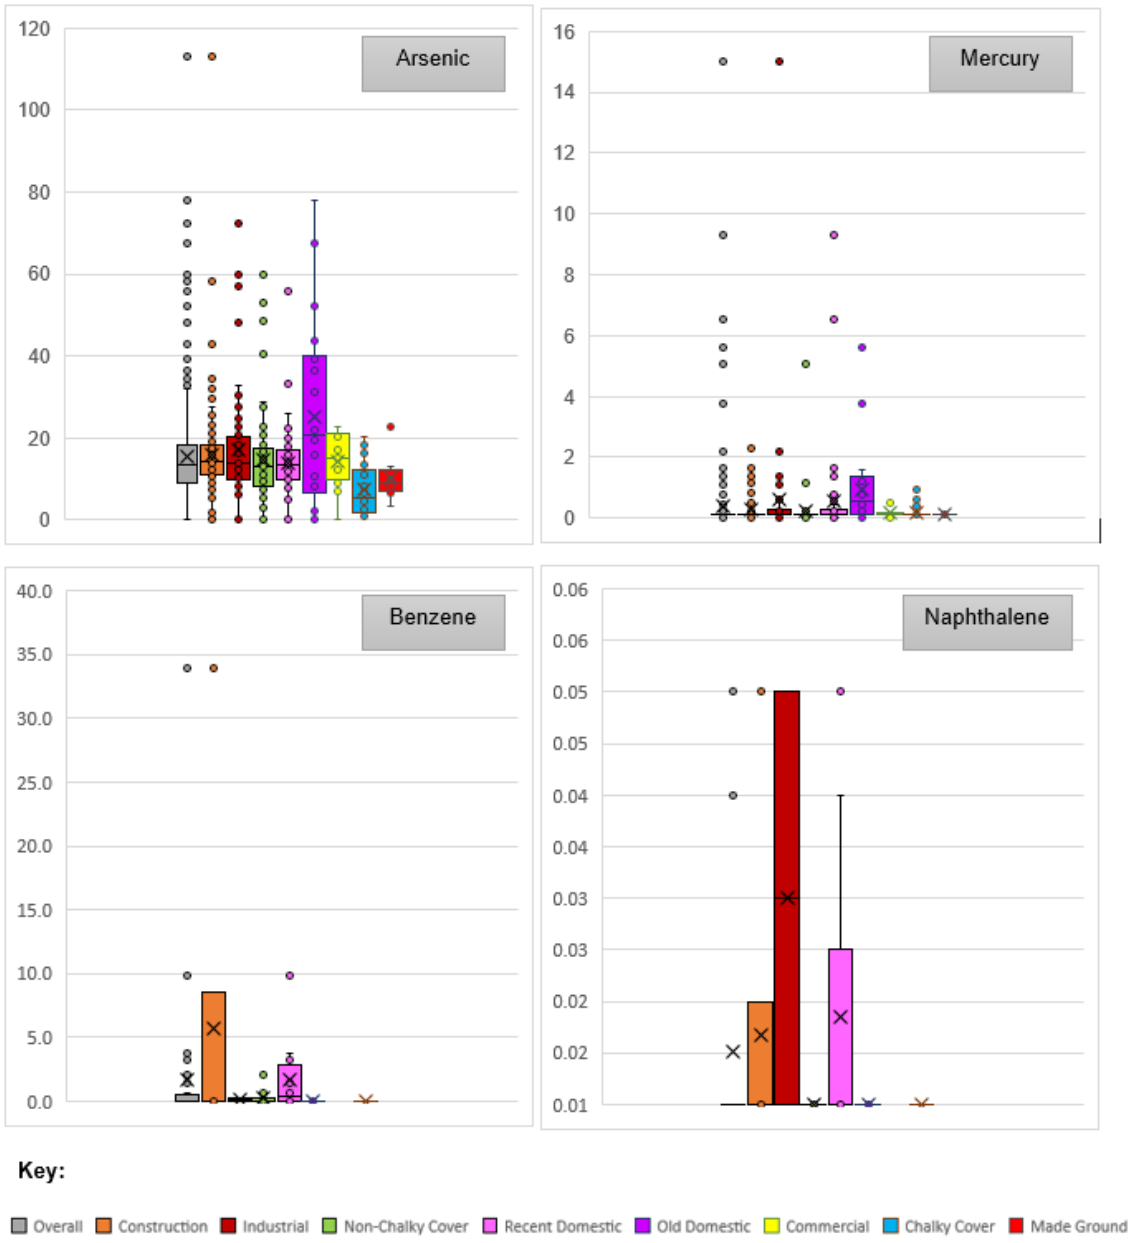


Table 8.3 Asbestos detections and quantities in waste types

Waste Type	No of samples	No. with asbestos fibres detected	% of detections	Min %w/w	Max %w/w
General Made Ground	14	2	14%	<0.001	0.0227
Commercial	12	4	33%	<0.001	<0.001
Old Domestic	19	4	21%	<0.001	0.963
Recent Domestic	50	12	24%	<0.001	0.225
Chalky cover material	28	1	4%	-	0.0534
Industrial	52	19	36%	<0.001	6.93
Non-chalky cover material	64	9	14%	<0.001	1.08
Construction	116	22	19%	<0.001	0.112

Decompostition status

8.2.10 The ability of a landfill to produce gas and leachate depends on the decomposition status of the waste and the age of the landfill. Therefore, it is important to understand the components in the waste which are degradable and the extent of degradation.

8.2.11 Degradation of waste material is controlled by the conditions in the landfill as well as the specific biochemical consistuents of the materials (i.e. their fat, sugar, protein, cellulose, hemicelluloses, lignin content etc). The degradation potential of materials is a function of the amount of degradable organic carbon (DOC) they contain, with cellulose and hemicellose making up 91% of the degradable carbon fraction. The typical degradability of different waste components from literature is presented in **Table 8.4** (Ref. 27).

Table 8.4 Degradability of different types of waste taken from LQM (2003)

Waste Category	Fraction of degradable carbon (%)			
	RM	MD	SD	Inert
Paper and card	0	25	75	0
Dense plastics	0	0	0	100
Film plastics	0	0	0	100
Textiles	0	0	100	0
Miscallenous non-combustible	0	0	0	100
Putrecible	100	0	0	0
Composted putrescibles	0	50	50	0

Waste Category	Fraction of degradable carbon (%)			
	RM	MD	SD	Inert
Glass	0	0	0	100
Ferrous metal	0	0	0	100
Non-ferrous metal and aluminium cans	0	0	0	100
Non-inert fines	100	0	0	0
Inert fines	0	0	0	100

Notes: RM- readily degradable. MD- moderately degradable. SD- slowly degradable

Degradable Organic Content (DOC)

8.2.12 The readily biodegradable fraction of municipal waste which can produce landfill gas is primarily made up of cellulose and hemicellulose, although not all the cellulose in waste is available for biodegradation. Therefore, the volume of degradable material can be estimated from the degradable organic content (DOC). The DOC of material has been estimated from the measured total organic carbon content (TOC) analysis from each era of filling using a conversion factor of 1.331 (Ref. 28). The range of DOC values are presented **in Table 8.5**

Table 8.5 Summary of the range of DOCs value of the landfill material within each era of filling

Waste Era	Location	Depth (mbgl)	Waste type	Range of values for degradable organic carbon (DOC) (%)
1947	LF-BH04	13.50	Industrial	7.8- 45.4
1955	LF-GW206	7.60	Old Domestic	0.09- 14.9
1960	LF-LW204	7.80	Construction	0.7- 23.51
1970	LF-BH228	5.30	Old Domestic	0.3- 18.32
1980	LF-BH212	9.40	Commercial	0.3- 37.15

8.2.13 The DOC readings suggest that the landfill waste is generally considered to have a low to moderate amount of DOC (28). However, there appears to be no significant correlation between the waste age/type and organic content of the landfill. Therefore, the nature of the degradable materials has been examined below to establish if any relationship exists.

Nature of degradable materials

8.2.14 Degradable materials encountered during the GI in the landfill comprised primarily of paper in its various forms (mixed paper, newsprint and corrugated) and wood. It is estimated that paper items account for 7.4 wt.% (2.1 vol.%) of the landfill mass, whilst wood waste accounts for 3.5 wt.% (4.9 vol.%) of the landfill. Newspaper print was noted from the forensic analysis to still be legible and relatively undegraded. However this should not be taken as an indicator of the overall degradation state of the landfill as newspaper does not degrade as efficiently as other paper such

as white office paper, due to its complex ligin-cellulose structure (Ref. 29) making it very slow to degrade.

8.2.15 Other clearly identifiable organic waste comprised textiles, rubber and leather, as well as other primarily combustible materials, which were classed under the ‘other organics/combustible’ waste fraction. Overall, this waste fraction comprised an average 5.3 wt.% (3.7 vol.%) of the total waste **(Drawing 4).**

8.2.16 Due to the age of the landfill (last known period of infilling recorded as late 1970s), biowaste comprising of garden waste, food waste and biological waste, was found to have degraded and was generally absent from the waste samples assessed. These three fractions, were observed, accounted for less than 0.5wt.% of the total weight of samples which is in agreement with the findings of previous studies (Ref. 30) that indicate that organic waste cannot be distinguished after 15 years of landfilling. This material is likely to have decomposed to a point where degraded organic matter and mineral content are now indistinguishable. Due to the low quantities of biowaste material observed, these items are included in the ‘other organics/combustibles’ waste fraction in Drawing 4. In total, it is estimated that 16.2 wt.% (10.7 vol.%) of the landfill is comprised of degradable material.

8.2.17 Field observations of the degree of degradation support this finding and with over 60% of the 189 samples assessed on site described as moderately (54%) or highly (7%) degraded.

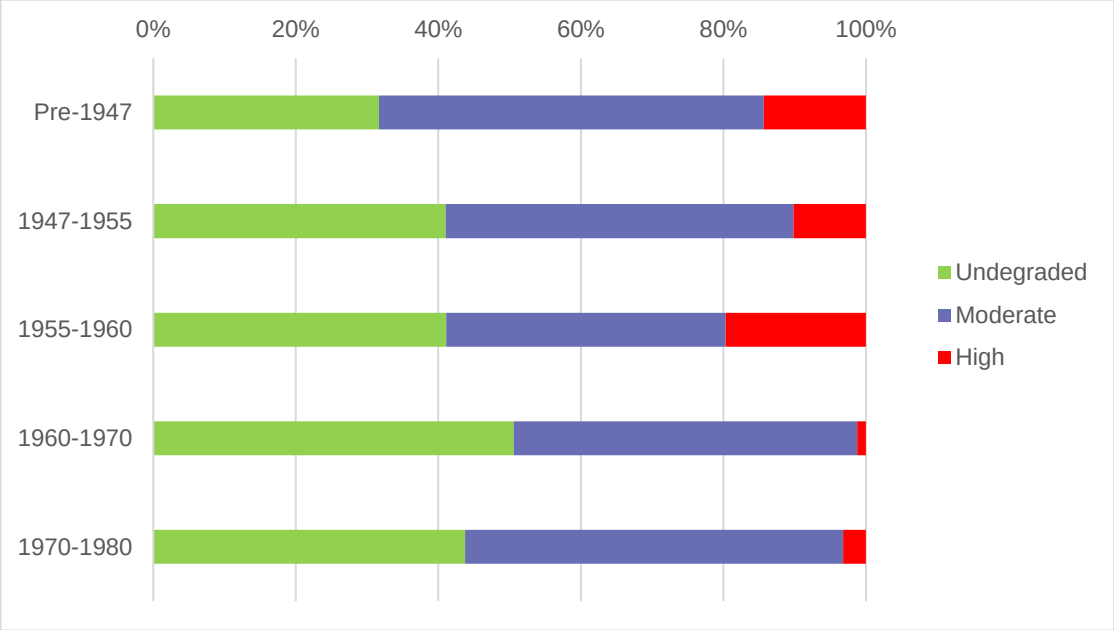
8.2.18 Non-degradable items encountered in the landfill include waste arising from construction and demolition activities (5.9 wt%) and material classed as ‘other non-organics/non-combustibles’ (67.2 wt%) comprising mostly of rock, sand, ceramics, bones, ash, clinker or slag. It is estimated that a total of 69 vol.% of the landfill is comprised of non-degradable materials.

8.2.19 In addition to clearly degradable and non-degradable materials, a minor fraction of the landfill is composed of inert items such as glass (2.8 wt.%), plastic (4.8 wt.%) ferrous (2.3 wt.%) and aluminium (0.8 wt%) waste.

8.2.20 When examined by age of waste there is a clear relationship to age. The older, pre-1960s, waste is predominately moderately or highly degraded (up to 75% degraded). In the younger waste (1970 onwards) there is still a

reasonably high component of undegraded waste (33-40%) with much less highly degraded waste. This is shown in **Drawing 8.**

Drawing 8 Observations of the degree of degradation of samples by era of landfill waste



Odours

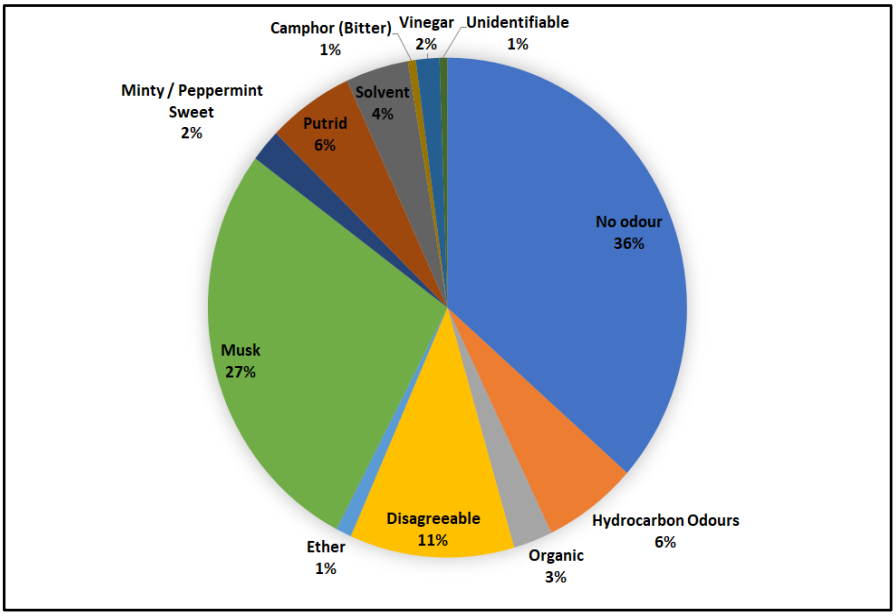
8.2.21 The assessment of odours provides qualitative information on potential contaminants within the waste and degradation state. The samples were described with an odour rating from 0 (no odour) to 5 (very strong). None of the samples analysed were described as having a strong odour. It should be noted that odours are very subjective, and observations can be interpreted differently by individuals.

8.2.22 The odours noted during exploratory locations were described into one of 12 categories. **Drawing 9** presents a summary of the overall odour observations. Approximately one third (37%) of the samples were found to have no discernible odour, with another third (28%) presenting a mostly musk odour which was occasionally associated with organic or hydrocarbon odours. Only 6% of the samples were described primarily as having a hydrocarbon smell (organic, petrol, diesel or tar) although hydrocarbons were frequently identified as secondary odours. Disagreeable odours (11%) were occasionally associated with a musk or organic smell. The musk and putrid notes odours are likely to be associated with the degraded waste and reflect the odours associated with volatile fatty acids such as propionic acid and formic acid (Ref. 31)(Ref. 32).

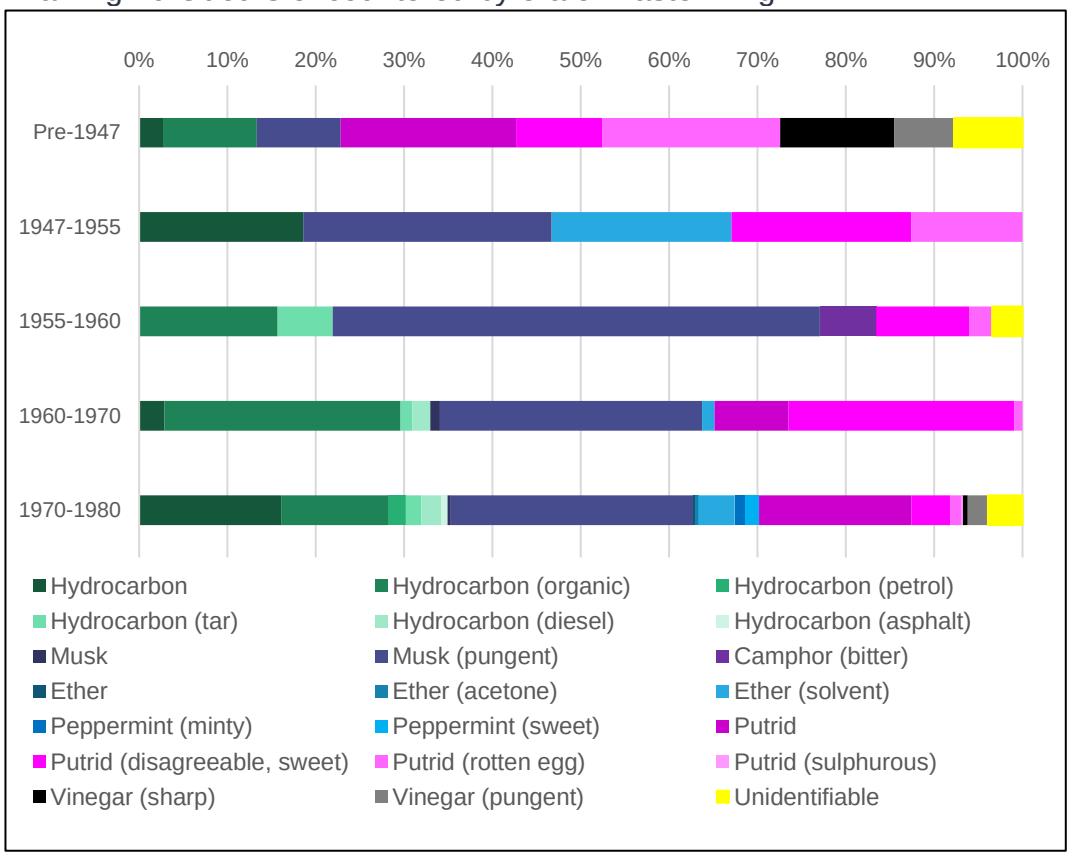
8.2.23 Review of the data by period of filling, indicated that hydrocarbon odours were most prevalent in the more recent waste (post 1970s) waste. Putrid and musk odours were more common in the older (pre-1960s) waste

which supports the fact that this material is more degraded than the more recent waste. This is shown in **Drawing 10.**

Drawing 9 Odour description of samples analysed by forensic



Drawing 10 Odours encountered by era of waste filling



8.3 Landfill leachate

8.3.1 The chemical quality of a landfill leachate is determined primarily by the composition and solubility of the waste constituents. Household waste and industrial waste will give rise to leachate. The leachate quality changes over time and for landfills which received non-hazardous municipal waste there is a series of distinct stages:

a. Leachate produced in the early stages of decomposition of waste is typically generated under aerobic conditions that produce a complex solution with near neutral pH. This stage generally only lasts a few days or weeks and is relatively unimportant in terms of leachate quality. However, because aerobic degradation produces heat, leachate temperatures can rise, sometimes as high as 80–90ºC, and if this heat is retained it can enhance the later stages of leachate production.

b. As decomposition processes develop, waste becomes anaerobic. At the early anaerobic stage (the acidogenic/acetogenic phase), leachate develops high concentrations of soluble degradable organic compounds and a slightly to strongly acidic pH. Ammonium and metal concentrations also increase during this phase. Even small quantities of this high-strength leachate can cause serious damage to surface water receptors.

c. After several months or years, methanogenic conditions are established, and the leachate becomes neutral or slightly alkaline, and of lower overall concentration, but it still contains significant quantities of some pollutants (e.g. ammonium).

d. As biodegradation nears completion, aerobic conditions may return, and the leachate will eventually cease to be hazardous to the environment.

8.3.2 Published literature reports that leachate from household waste is reasonably consistent in composition, with key changes in the composition occurring over time (as per stages 1-4 described above). As indicated in **Table 8.2,** the GI observations suggest that the landfill is predominantly construction waste, with some industrial, old and recent domestic wastes.

8.3.3 The quality of leachate obtained from the landfill has been compared to published literature values for recent and aged domestic wastes in **Table 8.6** to give an understanding of the stage of decomposition and the pollution potential of the leachate being generated.

Table 8.6 Comparison of literature values of typical composition of leachate from recent and aged domestic wastes at various stages of decomposition compared to leachate measurements from the site

Determinand	Leachate from recent wastes[1] (mg/l)	Leachate from aged wastes[1] (mg/l)	Average concentrations recorded in on-site leachate monitoring wells (mg/l)						
			LF-BH06	LF-BH12A	LW201	LW202	LW203	LW204	LW205
pH	6.2	7.5	6.9	6.7	7.3	8.06	7.9	7.4	7.1
COD	23,800	1,160	773	359	734	4,240	1,420	2,673	6,297

Notes:
[1] Typical composition taken from Waste Management Paper No.26 Landfilling Wastes (1986)
[2] Sum of fatty acids (C2-C7) above limit of detection; ethanoic acid, butanoic acid, hexanoic acid, propanoic acid and pentanoic acid

8.3.4 The comparison in Table 8.6 indicates the following:

a. The levels of contaminants are broadly consistent with leachate from aged waste, with the concentrations of many contaminants lower than those typical of an aged waste e.g. ammoniacal nitrogen, magnesium, manganese, zinc and lead.

b. The BOD to COD ratio provides an indication of the amount of organic matter present, a high ratio of BOD to COD suggest a large amount of biodegradable organic matter is present in a landfill. In LF-BH12A and LW204 the BOD/COD ratio is lower than that of a typical recent waste but slightly higher than an aged waste

suggesting that there may still be significant biodegradable matter in this part of the landfill. Both of these wells are located in the southern section of the landfill with LW204 towards the centre where the waste extends to approximately 11 m depth.

c. The BOD/COD ratio in the other leachate wells is similar to that of an aged waste, these wells are located across the northern and south west parts of the landfill.

d. Volatile fatty acids (VFAs) are formed via anaerobic degradation of larger organic molecules. The presence of VFAs such as acetic acid, would suggest that the landfill is continuing to break down organic matter and produce leachate. However, they are not present in very high concentrations in any of the wells, when compared to leachate from a typical recent waste, which suggests the landfill is approaching an aged state (between stages 3 and 4 outlined above).

e. The highest concentration of fatty acids was recorded in LW201 which is one of the locations where there has consistently been a greater accumulation of leachate recorded within the landfill. No VFAs were detected in leachate sampled from LF-BH06, LW203 or LW205.

8.1 Comparison with other landfills

8.1.1 There is very little available literature on the composition of waste in similar aged landfills within the UK. The most relvent information on composition of landfilled waste is a review of 60 landfill mining projects across Europe where the composition was determined (Ref. 33). **Table 8.7** indicates that the waste composition of Luton is broadly similar to other typical landfills across Europe.

Table 8.7 Average (wt.%) waste composition and comparison with literature values.

Waste Component	Typical Landfill (various countries) (wt.%)	Former Eaton Green Landfill (wt.%)
All paper fractions	5.3	7.5
Wood	3.5	3.5
Other organics / combustibles	11.1	5.3
Total Degradable Materials	***19.9***	***16.3***
Minerals / inert	5.8	-
Construction waste	9.0	5.9
Other non-organics	57.3	67.2
Total Non-Degradable Materials	***72.1***	***73.1***
Glass	1.1	2.8
Plastic	4.7	4.8
Total metals	2.0	-
Ferrous	-	2.3
Aluminium	-	0.8
Other	***7.8***	***10.7***

8.2 Interaction of earthworks with landfill

8.2.1 The proposed works have been designed to minimise the amount of landfill waste required to be excavated. The volumes of material to be excavated at each phase of the Proposed Development are shown in **Table 8.8**

Table 8.8 Volumes of landfill material proposed to be excavated in each phase

Phase	21.5mppa	21.5-27mppa	27-32mppa	Total required to achieve 32 mppa
	m^3	m^3	m^3	m^3
Landfill	27,000	312,000	11,000	350,000

8.3 Summary of waste characteristics

8.3.1 The waste forensics assessment, review of the exploratory logs, site photographs and site observations on the former landfill indicated the following:

a. much of the waste was deposited 40-50 years ago, and initial filling started almost 80 years ago. The most recent waste, in the capping layer, was deposited 30 to 40 years ago;

b. the waste is reasonably well degraded with no discernible biowastes. The slower degradable fractions of material are remaining such as newspaper;

c. an analysis of the waste components indicates that 69% is non-organic/non-combustible material;

d. the waste contains a high proportion of cover material (both non-chalky and chalky), particularly in the more recent wastes (1970s onwards);

e. a large portion of the waste is categorised as construction (36 vol.%) or cover material (27 vol.%);

f. the old domestic waste has higher heavy metal concentrations, which may be a function of the predominate material in this waste being ashy material;

g. there was no clear trend shown with the organic contaminants. However generally industrial, construction and recent domestic had higher concentrations than the other waste types;

h. chemical analysis of the landfill leachate indicated the levels of contaminants are broadly consistent with leachate from aged waste, with the concentrations of many contaminants lower than those typical of an aged waste e.g. ammoniacal nitrogen, magnesium, manganese, zinc and lead;

i. asbestos was detected most frequently and at the highest quantities in the industrial waste; and

j. overall there is no distinct spatial variation in the waste types or chemistry. The relative proportions of different waste types are defined by the era in which it was deposited. As such it is not considered necessary to sub-divided the landfill for any of the subsequent assessment detailed in the following sections.

9 GENERIC QUANTITATIVE RISK ASSESSMENT

9.1 Risk assessment process

9.1.1 The statutory guidance which accompanies Part 2A Environmental Protection Act 1990 legislation[34] details that the significance of any contamination should be evaluated through a risk assessment. The current best practice for risk assessment methodology is detailed in Environment Agency's Land Contamination Risk Management Guidance[2.]

9.1.2 The risk assessment process is underpinned by the concept of establishing whether a contaminant linkage exists between a source and a receptor via a viable pathway. For a potential risk to exist all three elements must exist to form a contaminant linkage.

9.1.3 The risk assessment process aims to establish whether unacceptable risks exist and if so what further actions need to be taken in relation to the site. It is an iterative tiered approach which consists of three progressively detailed stages of risk assessment; PRA, GQRA and DQRA. Depending on the nature of the site and contamination present, not all stages of risk assessment may be required.

9.2 Overall approach

9.2.1 As identified in **Section 9**, the PRA identified that Area A (former landfill) and the Airport Access Road, were the only areas requiring further risk assessment. Therefore, the assessment will focus on these areas.

9.2.2 As described in **Section 9**, overall there is no distinct spatial variation in the waste types or chemistry. As such it is not considered necessary to sub-divided Area A for the risk assessment. The risk assessment considers a reasonable worst-case scenario is representative of the conditions at the landfill. This is considered conservative but allows for the heterogenous nature of the landfill in the assessments.

9.2.3 Construction related impacts have been considered, where appropriate, in the assessment. Any breaking out of surfaces along the Airport Access Road where Made Ground or landfill material will be exposed, as well as the excavation work to the landfill for the Proposed Development described in **Section 2.4** will be undertaken in a manner in such that the potential impacts are controlled and minimised. These control measures will be detailed in the Draft Construction Code of Practice (**Appendix 4-2** to the PIER) and Remediation Strategy (**Appendix 17-5** to the PIER).

9.3 Data used in assessment

Area A - Former Landfill

9.3.1 All available data from the following GIs **(see Figure 10)** has been used to assess the conditions within Area A and the potential for impacts outside of the landfill boundary:

a. AECOM (2019) Luton Airport Landfill, Main Ground Investigation – Factual Report;
b. AECOM (2018) Luton Hangar 24 Ground Investigation, Factual Ground Investigation Report;
c. Structural Soils Limited (2017) Landfill Factual Report on Ground Investigation;
d. Structural Soils Limited (2017) Century Park Factual Report on Ground Investigation;
e. Structural Soils Limited (2017) Century Park Access Road, Factual Report on Ground Investigation; and
f. Concept Site Investigations (2015) Luton Airport Terminal Extension, Site Investigation Report.

Airport Access Road

9.3.2 Two GI's have been undertaken along the proposed road alignment:

a. Structural Soils Limited (2017) Century Park Access Road, Factual Report on Ground Investigation; and
b. Geotechnics Ltd (2018) Century Park Access Road Additional Works, Factual Report. Draft.

9.3.3 It is pertinent to note that the Airport access Road traverses the former Landfill towards the eastern extent and data from this area has been assessed under Area A.

9.4 Adequacy of data

Eaton Green Landfill

9.4.1 As discussed in **Section 4.1.3** preliminary and detailed GIs have been undertaken within the landfill area. The sampling locations have a good spatial, lateral and vertical distribution, encompassing all the main eras of waste deposition. A substantial number of samples have been undertaken including; soil (1219 samples), groundwater and leachate (328 tests) and gas/VOC samples (96 tests) to industry standards providing a comprehensive dataset for the area.

9.4.2 A considerable amount of gas monitoring has also been undertaken which has included:

a. twelve months' worth of spot gas monitoring (i.e. levels measured at monthly intervals from boreholes);
b. continuous gas monitoring in five boreholes across the landfill during the recent GI (which have taken continuous readings over a 3-month period); and
c. samples of bulk and trace gases to determine the constituents and volumes of gases within the landfill.

9.4.3 The investigations undertaken to date provide a good understanding of the general composition of the waste, groundwater, leachate and landfill gas conditions. Therefore, the data is considered to be adequate to inform the risk assessment. It should be noted there were some areas of the former landfill which were not accessible during the GI, including parts of the landfill which were airside and the southeastern end of the landfill which had a steep slope. Further GI may be required in these areas prior to works to ensure they are consistent with the general understanding of the ground conditions.

Airport Access Road

9.4.4 Two phases of ground investigation have been undertaken for the Airport Access Road in 2017 (Ref. 8) and 2018 (Ref, 9) which were reviewed in the PRA (Ref. 1). The sampling locations are distributed across the route at approximately 50m spacing. Chemical testing was not undertaken at each location, so in some areas the chemical sampling density does not meet that of an exploratory investigation as set out in BS10175 (Ref. 11). Samples were tested for a range of analytes relevant to the past contaminative land uses and provides a preliminary dataset to assess the risks posed to human health.

9.4.5 No groundwater testing or leachate testing was undertaken as part of the GI works. It is not envisaged that the proposed earthworks will interact with the groundwater. However, this will need to be reviewed at the detailed design stage.

9.4.6 Ground gas monitoring collected during the GI works has been used as part of an overall assessment of the area outside of Eaton Green Landfill.

10 HUMAN HEALTH GENERIC QUANTITATIVE RISK ASSESSMENT

10.1 Methodology

Soil

10.1.1 A human health generic quantitative risk assessment (GQRA) has been undertaken in accordance with the Environment Agency's Contaminated Land Exposure Assessment (CLEA) framework (Ref. 35). The CLEA model estimates human exposure (children and adults) to soil contaminants for those potentially living, working and/or playing on contaminated sites over long time periods (chronic exposure). It does not assess risks to groundwater and does not include short-term risks, for example to construction workers. Risks to construction workers should be covered by appropriate site management plans i.e. construction code of practice. However, an initial assessment of the acute risks has been undertaken to inform management of risks during future works. The approach to the acute generic risk assessment is described below in **Section 10.1.12.**

Radionuclides

10.1.2 Percival Works, which was located immediately west of the site, was a former aircraft manufacturer, including during World War II. It is known that during this period aircraft dials were commonly painted with radium to make them luminous. The PRA identified the potential for radionuclides to be present in the waste materials in Area A, if luminous aircraft dials from the nearby Percival Works were disposed there.

10.1.3 A survey was undertaken after the GI works to follow up on locations where readings had been encountered above background levels. This further survey **(Appendix C)** indicated that the levels of radionuclides detected were consistent with expected natural background levels and do not pose a risk to health. Therefore, no further risk assessment of the radionuclide risks is required. However, a watching brief will be required during excavation works and procedures in place to ensure any suspected radionuclide containing material encountered is appropriately managed.

Statistical analysis

10.1.4 A review of the data indicated that statistical analysis is unlikely to be appropriate for assessing the human health risks from the soils/waste in Area A for two main reasons:

a. Trial pits provide good representation of the material but were not able to progress beyond 5 m in the landfill waste. Therefore, the data is skewed towards the shallower horizons of the landfill due to the depth of the waste. **Table 10.1** indicates the number of samples obtained from the various depth horizons within the landfill. As detailed within the CL:AIRE guidance (Ref. 36), it is not appropriate to apply statistical testing to biased sampling; and

b. The conditions in the landfill are extremely variable therefore it is unlikely that the contamination concentrations detected will be attributable to any underlying population.

10.1.5 The ground model developed has been used to collate all the historical, site investigation and other data to develop an understanding of the contaminant concentrations and characteristics across the site based upon a “lines of evidence” methodology.

Table 10.1 Number of samples obtained for chemical analysis from within the landfill by depth

Depth (m bgl)	No. Samples
0 – 5	358
5 – 10	86
10 – 15	34
15 – 20	9
20 – 25	1
Total	488

10.1.6 Statistical analysis was also not applied to the Airport Access Road due to the following reasons:

a. The chemical sampling density is not sufficient to allow determination of suitable averaging areas or allow robust statistics; and

u. Chemical sampling along the route was largely targeted on potential areas of contamination and as detailed within the CL:AIRE guidance (36), it is not appropriate to apply statistical testing to biased sampling.

10.1.7 Therefore, comparison of the maximum concentration against appropriate assessment criteria is considered suitable for a preliminary assessment of the potential risks to human health receptors.

Chronic Exposure Risk Assessment

10.1.8 In order to use the most appropriate assessment criteria for determining the potential risk to future users, it is important to consider the proposed end use in the area. The proposed development within Area A and along the Airport Access Road includes:

a. Hotel;

b. Energy centre;

c. Café;

d. Offices/light industrial premises;

e. Areas of landscaping;

f. Car parking associated with the office/industrial units;

g. Access road;

h. DART extension from T1 and new DART station;

i. New terminal building; and

j. Apron, stands and taxiways.

10.1.9 **Table 10.2** below provides justification for the Generic Assessment Criteria (GACs) selected for proposed land use associated with the proposed development. The soil analysis has then been compared to the lowest GAC for each contaminant for the proposed land uses in order to make an initial conservative assessment of the potential risk to human health. A soil organic matter (SOM) content of 1% has been used to provide an initial assessment.

10.1.10 The chronic exposure risk assessment is based on the current proposals. If the proposed end uses change to a more sensitive use then revaluation of the data may be required.

Table 10.2 Summary of proposed infrastructure in the development

Infrastructure proposed	Generic assessment criteria	Justification
Hotel	Female Adult Commercial	The future occupants of hotel may include children using the hotel. However, their exposure is likely to be infrequent and short in duration. Therefore, the most sensitive receptor is considered to be those working at the hotel, who are likely to have more prolonged exposure.
Energy centre		General public are unlikely to access the energy centre, therefore the most sensitive receptor is considered to be those working at the energy centre.
Café		Future visitors the café may include children, however their exposure is likely to be infrequent and short in duration. Therefore, the most sensitive receptor is considered to be those working at the café.
Offices/light industrial premises		The most sensitive receptor is considered to be those working at the office/light industrial premises.
Areas of landscaping	Female child 0 – 6 years – Public open space	These areas of the proposed scheme are likely to be accessible to the general public meaning children accessing the site may have occasional contact with soils and or inhalation of gases/vapours. Therefore, public open space criteria for a child aged 0-6 years has been considered sufficiently protective of end users of this area.

Infrastructure proposed	Generic assessment criteria	Justification
Car parking associated with the office/industrial units	Female adult maintenance worker for open space	No potential for accumulation of vapours or gases in indoor air. Areas to be covered in hardstanding so no potential for member of the public to come into contact with underlying soils. Therefore, main receptor is considered to be a maintenance worker who may have occasional direct contact with soils.
Airport Access Road		No potential for accumulation of vapours or gases in indoor air. Areas to be covered in hardstanding so no potential for member of the public to come into contact with underlying soils. Therefore, main receptor is considered to be a maintenance worker who may have occasional direct contact with soils.
Extension of the DART from T1 and new DART station.	Female Adult Commercial	The future users of the airport will be members of the public including children. However, their exposure is likely to be infrequent and short in duration. Therefore, the most sensitive receptor is considered to be those working at the airport, who are likely to have more prolonged exposure.
New terminal building, apron, stands and taxiways		

Dioxin, furans and dioxin like polychlorinated biphenyls (PCBs) compounds

10.1.11 The approach outlined in the above sections has been used for assessing the chronic exposure risk to all contaminants with the exception of dioxin, furans and dioxin like polychlorinated biphenyls (PCBs) compounds. These compounds were identified as potential contaminant of concern in Area A from the PRA. A different approach is required for these compounds as the published GACs are based on the assumption that the source is atmospheric deposition. This is unlikely to be the case for Area A, as sources are more likely to be from material deposited in the landfill such as electrical equipment. Therefore, the published Environment Agency excel worksheet for PCDD, PCDFs and dioxin-like PCB compounds for a commercial land use scenario (Ref. 37) has been used to enable a site-specific comparison of total exposure from these compounds in soil with the health criteria value. This results in a Hazard Index (HI). A HI greater than 1.0 indicates a potential risk and further consideration is required. A HI of less than 1.0 indicates that the concentration does not pose a potential risk to future users of the site.

Acute Exposure Risk Assessment

10.1.12 The principal risks to human health are from the chronic risks resulting from long term exposure to specific contaminants. Chronic risks often occur at lower doses than acute risks, therefore they are often the key risk driver. The Society of Brownfield Risk Assessment (SoBRA) recently published an approach for assessing acute risks to human health from short term exposure to soil contamination and associated acute generic assessment criteria (AGAC) (Ref. 38). The SoBRA approach looks at two scenarios:

a. Short term exposure of the public by direct contact or ingestion. In addition, inhalation of dusts or vapours arising from excavation activities (e.g. during construction or remediation) The direct contact pathways assumes trespass onto an active construction site, which is considered unlikely but has been included as a conservative assessment of the risks; and

b. Short term exposure by workers involved with excavations.

10.1.13 It is not intended to replace health and safety guidance on managing risk and controlling exposure, or replace monitoring, or other controls. It is intended to highlight potential acute risks prior to work commencing and/or inform the design of appropriate cover systems.

10.1.14 The maximum soil concentrations have been compared to the AGAC derived by SoBRA.

Groundwater Vapours

10.1.15 Volatile contaminants in groundwater have the potential to cause risk to human health via volatilisation and migration of vapours into overlying buildings or outdoor air space followed by inhalation.

10.1.16 The groundwater in the underlying chalk aquifer is at a significant depth below the ground level, typically 40 mbgl, beneath both the landfill and Airport Access Road and as such there is not considered to be a potential risk to the future development from volatilisation of contaminants. However, during the 2018 GI some perched water was encountered in the landfill. Therefore, the potential risks associated with volatile contaminants in perched water has been assessed.

10.1.17 In order to assess this the measured concentrations of volatile contaminants in groundwater have been compared with published groundwater vapour generic assessment criteria (GACgwvap) developed by SoBRA (Ref. 39).

10.1.18 Further details of the assessment criteria used for both soil and groundwater are presented **in Appendix E**

Soil Gas Vapours

10.1.19 There are no generic assessment criteria for assessing soil gas vapour concentrations. Therefore, PCLs associated with soil gas vapours have

been considered through DQRA and are presented in the DQRA for Human Health, **Appendix 17-3** of the PEIR.

Asbestos

10.1.20 The term ‘asbestos’ refers mainly to six fibrous minerals that are known to cause serious health effects when inhaled. The main commercially exploited forms are chrysotile (white asbestos), amosite (brown asbestos) and crocidolite (blue asbestos). Between 1900 and 1980, asbestos was widely used in a plethora of construction and insulation products due to the physical, thermal and chemical properties of the fibres. The importation of crocidolite had ceased by 1970 (except for limited specialised applications such as battery casings). The importation of amosite ceased in 1980. The importation and use of asbestos in the UK was finally banned (for nearly all purposes) in 1999 (Ref. 40).

10.1.21 Asbestos-containing materials (ACMs) are found commonly in buildings constructed up to the year 2000 as floor and ceiling tiles, pipe lagging, insulation board, roofing materials, protective coatings, textured decorations etc, as well as being widely used in brake linings.

10.1.22 Historical waste management and demolition practice has resulted in asbestos-containing materials (ACMs) being potentially present in the soil or made ground at any brownfield site (Ref. 40).

10.1.23 In order for asbestos found within soil to pose a risk to health, it has to be present in a form that can release fibres to air for inhalation. Currently there is no UK soil guideline criteria for Asbestos Containing Soils (ACS) in relation to the risk from long-term environmental exposure to human health. The research to date suggests (Ref. 40) there is no safe or threshold level for asbestos exposure below which there is no discernible increase in risk.

10.1.24 In the absence of any published threshold value the WHO Air Quality Guideline (Ref. 41) value of <0.001 fibres/ml (equivalent to 0.001 %w/w) has been used as initial screening criteria to determine whether further assessment is required.

10.2 Results

Comparison of soil analysis to GAC’s

Chronic assessment criteria

10.2.2 Comparison of the soil samples against the GAC indicated exceedances within Area A as summarised in **Table 10.4** and shown on **Figure 16.**

10.2.3 No exceedances were observed along the Airport Access Road against the GAC for commercial /industrial end use. However several samples exceeded the soil saturation limits for particular TPH chains and a few PAHs, see **Table 10.3.** The full screening assessment is provided in **Appendix E.**

Table 10.3 Exceedance of soils saturation limits for TPH and PAHs for the Airport Access Road

Contaminant	Number of exceedances/ (total samples tested)	Location	Depth (mbgl)	Maximum Conc. (mg/kg)	Soil Saturation Limit	GAC (mg/kg)
PAHs						
Indeno (1,2,3-c,d)pyrene	15/(43)	PFCPRC24	15.0	1.54	0.15	506
Dibenzo(ah) anthracene	9/(43)	PFCPRC24	15.0	0.21	0.0098	3.55
Benzo (g,h,i) perylene	22/(43)	PFCPRC24	15.0	1.47	0.04	3950
Chrysene	1/(43)	PFCPRC24	15.0	1.23	1.10	352
TPH						
Aromatic C21-C35	5/43	PFCPRC04	0.6	236	12.1	28400
Aliphatic C16-C21	2/43	PFCPRC04	0.6	103	21.2	10700000
Aliphatic C21-C35	5/43	PFCPRC04	0.6	584	21.2	10700000

10.2.4 The samples where the soil saturation limits are exceeded are all Made Ground and generally reworked chalk with limited visual or olfactory evidence of potential contamination sources other than occasional gravel of clinker. Exploratory hole PFCPRC24 which has the maximum concentrations recorded strong hydrocarbon/organic odour. Although the soil saturation limits are exceeded none of exploratory hole logs recorded any free-phase petroleum products. The TPH fractions which are recorded as exceeding the soil saturation limit all have a carbon chain greater than C16 (The 'C' refers to the length of the carbon chain in the chemical compound). These fractions have an air-water partition coefficient (K_{aw}) lower than 4 $x10^{-4}$, which means they are not considered to be volatile (Ref. 42). Combined with the fact there is no free-phase and no evidence of a contaminant source it is unlikely a potential vapour pathway from soil contaminants would be formed and therefore this has been excluded from further assessment.

Table 10.4 Exceedances of contaminants in soil when compared to generic assessment criteria (GAC) for Area A.

Contaminant	Number of exceedances/(total samples tested)	Location	Depth (mbgl)	Concentration (mg/kg)	Waste type	GAC (mg/kg)
Polyaromatic Hydrocarbons						

Contaminant	Number of exceedances/(total samples tested)	Location	Depth (mbgl)	Concentration (mg/kg)	Waste type	GAC (mg/kg)

Notes:
Green shaded cells indicate exceedances are within an order of magnitude of the GAC
Orange shaded cells indicate exceedance are within two orders of magnitude of the GAC
Red shaded cells indicate GAC is exceeded by more than two orders of magnitude of the GAC
[i] Public Open Space Park GAC
ii Commercial GAC
iii Public Open Space Maintenance Worker GAC
* Locations are within area which will be excavated to form the aviation platform
**GAC is based on chromium III, no exceedances of chromium VI GAC.

10.2.5 Comparison to the assessment criteria indicated the following for Area A:

a. Overall there was very few exceedances in relation to the number of tests undertaken. For all contaminants less than 3 % of the samples undertaken for analysis had exceedances.

b. The majority of the exceedances were within the construction waste type (40 %). Non-chalky cover, recent domestic and industrial waste types had 14 %, 15 % and 17 % of the overall exceedances respectively. The fewest exceedances were in the old domestic (11 %), commercial (1 %) and chalky cover (1 %) waste types.

c. Exceedances were mainly for polyaromatic hydrocarbons (PAHs) and metals. The risk driving pathway for these contaminants is through direct contact pathways such as dermal contact, soil ingestion and inhalation of soil derived dusts. These contaminants are not volatile and therefore do not pose a risk through inhalation of vapours.

d. The majority of the exceedances are within one order of magnitude of the GAC, with a number only marginally exceeding the criteria.

e. One marginal exceedance for beryllium was noted in the natural strata at BH228 (10.8m bgl). Future receptors will not come into contact with material at this depth and therefore it is not considered a potential risk.

f. Occasional exceedances were noted which were greater than one order of magnitude of the GAC for nickel, lead and 1,2,4-Trimethylbenzene. These occasional elevated concentrations reflect the variable nature of the waste. The main risk from lead and nickel

contamination is through direct exposure to the contaminant in the soils i.e. ingestion or inhalation of soil derived dusts. The exceedances were located at 6.4 m and 5.5 m respectively, any future receptors are unlikely to come into contact with contaminants at this depth. 1, 2, 4- Trimethylbenzene is a volatile aromatic hydrocarbon. The highest exceedances of this compound was at GW203B (4.7m bgl) and was co-located with other volatile compounds which exceeded their respective GACs i.e. naphthalene and 2-methylnaphthalene. The main risk driving pathways from these compounds is inhalation. The risks from soil vapours requires further consideration and is assessed further as part of a DQRA.

g. Overall the concentration of contaminants are not significantly elevated. The majority of contaminants present pose a risk through direct contact and as the development is largely hardstanding (see Figure 16) future users are unlikely to come into direct contact with the underlying material. However, given the heterogeneous nature of landfills and the lack of engineered cover system, it should be assumed that measures will be required, particularly in landscape areas, to prevent direct contact with the waste.

Acute assessment criteria

10.2.6 Comparison of the soil samples against the AGAC is shown in **Table 10.5.** The results only indicated one exceedance for arsenic of the oral criteria for a child trespasser within Area A. As previously discussed this scenario is considered unlikely. Appropriate measures should be undertaken during construction to ensure the site is secure and dusts are controlled. Based on the results of the acute assessment no special precautions, above and beyond best practice, are considered necessary during construction works to control potential acute risks.

Table 10.5 Comparison of maximum soil concentrations to AGAC

Contaminant	Receptor	Pathway	AGAC (mg/kg)	Max Recorded Value (mg/kg)	
				Area A	Airport Access Road
Arsenic	Child	Oral	80	113	17
		Dermal	7,000,000		
	Adult	Oral	7,000		
		Dermal	14,000,000		
Benzene	Child	Oral	47	0.37	<LOD
		Dermal*	14,000,000		
		Inhalation	190		
	Adult	Oral*	4,100		
		Dermal*	79,000,000		
		Inhalation	370		
Cadmium	Child	Oral	140	73.9	10.6
		Inhalation	1,800,000		
	Adult	Oral	12,000		

Contaminant	Receptor	Pathway	AGAC (mg/kg)	Max Recorded Value (mg/kg)	
				Area A	Airport Access Road
		Inhalation	3,500,000		
Free Cyanide	Child	Oral	24	<LOD	No Testing
		Inhalation	380		
	Adult	Oral	2,100		
		Inhalation	1,400		
Phenol	Child	Oral	2,000	370	No Testing
		Inhalation*	160,000		
	Adult	Oral*	175,000		
		Inhalation*	320,000		
Trichloroethene (TCE)	Child	Inhalation	16,000	0.24	<LOD
	Adult		33,000		
Vinyl Chloride	Child	Inhalation	110	<LOD	<LOD
	Adult		220		

Notes:
* AGAC likely to exceed soil saturation limits.
<LOD = all results less than Limit of Detection

Groundwater Vapour Assessment

10.2.7 Comparison of the perched groundwater samples against the GACgwvap is summarised **in Table 10.6.** The assessment was completed for Area A only no groundwater samples were obtained for the Airport Access Road and this PCL has been discounted for this area as there are no buildings or enclosed spaces planned. See **Appendix E** for the detailed assessment.

Table 10.6 Exceedances of contaminants in groundwater when compared to generic assessment criteria (GACgwvap).

Contaminant	Location	Installation response zone	Concentration (mg/l)	GAC (mg/l)
TPH >C10-C12 Aliphatic	WS224	1-5m	3.64	3.6*
			4.51	
1,2,4 Trimethylbenzene			4.49	2.2**
			3.04	

Notes:
* Solubility limit for contaminant is 0.034 mg/l
** Solubility limit for contaminant is 559 mg/l

10.2.8 The results for Area A indicated the following:

a. Only one location, WS224, had exceedances of contaminants in the perched groundwater when compared to the GACgwvap. This location is within the current Long Term Car Park (LTCP).

b. The solubility limit for TPH >C10-C12 aliphatic was exceeded, suggesting that free product may be present at this location. During the monitoring rounds a thin layer of product was consistently noted on the surface of the water at this location and the laboratory comments confirmed that this sample contained oil/product.

c. Observations from site during the GI works at location WS224 showed heavy black staining between 4-5m bgl **(Photograph 3),** suggesting the presence of localised product. An elevated PID reading of 185.6 ppm at 3.6m **bgl (see Table 4.4)** was also noted at this location.

d. No product was noted at any other locations within the LTCP. Therefore, this location appears to be an isolated hotspot.

e. WS224 is in proximity to the exacavation works for the aviation platform and there is the potential for the product present to be mobilised during the works and a pathway created to the underlying Chalk. Therefore, the free product at this location should be removed as part of the works. Any perched water in the material should also be removed. The material from this location is unlikely be suitable for reuse without treatment to remove the product present. The removal of this material should be included within the Remediation Strategy.

Photograph 3 Staining noted in core at location WS224 between 4-5m bgl

10.3 Asbestos

Area A

10.3.1 There are two identified potential sources of asbestos within Area A:

a. Former landfill - historically asbestos has been used in a wide range of products and forms. Therefore, there is the potential for asbestos products to be present in the landfill; and

b. Former scrap yard - the area which is currently occupied by Tidy Tip **(see Figure 4**) was identified in the PRA (Ref. 1) as historically been used as a scrapyard. Therefore, asbestos products may be presented

associated with clutch and brake linings. Any asbestos waste from the scrapyard may have been disposed of in the landfill and dispersed or may still be present locally in the area of the former scrapyard.

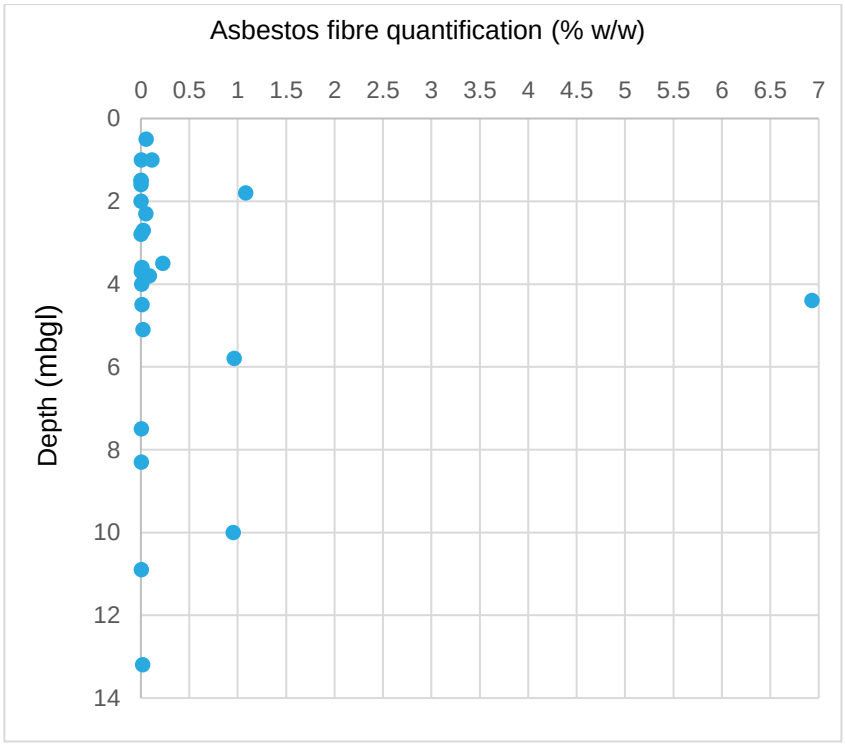
Former Landfill

10.3.2 Asbestos testing has been undertaken during both the preliminary and detailed GI. During the initial phase of investigation in 2016/17 asbestos testing was undertaken on 28 samples and was found to be present in three locations. Where asbestos was found, quantification was undertaken. Loose fibres of chrysotile were identified at LF-BH03, LF-BH07 and LF-BH08 and all were less than the limit of detection (<0.001% w/w).

10.3.3 Asbestos testing was undertaken on 355 samples and asbestos fibres/ACMs were visually identified and/or confirmed to be present in 73 samples. The asbestos was generally in the form of chrysotile or amosite fibres or combination of chrysotile and amosite. Only one sample proved positive for crocidolite, which was present combined with chrysotile.

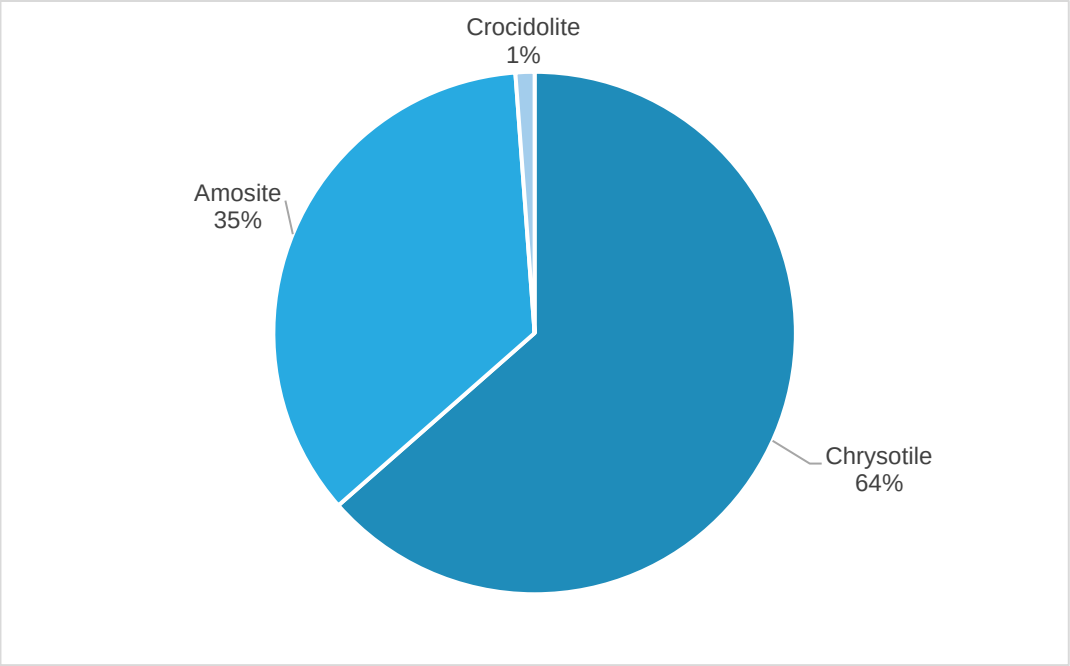
10.3.4 No asbestos caches or 'cells' of asbestos waste were identified, results indicate asbestos fibres and ACMs are dispersed throughout the landfill mass at various depths. Asbestos quantification was undertaken on 68 samples, the distribution of results is shown in **Drawing 11** and this indicates that higher asbestos fibre quantities were detected in the top 5m of the landfill. However, this is likely to be a result of the higher sampling frequency at this depth, see **Section 10.1.**

Drawing 11 Asbestos quantification in the landfill compared to depth



10.3.5 Chrysotile (white asbestos) was historically the most commonly used form of asbestos in the UK (Ref. 43). This is reflected in the results from the GIs which indicated 64% of the asbestos fibre detections were for chrysotile **(see Drawing 12).**

Drawing 12 Percentage of asbestos types identified during the GIs



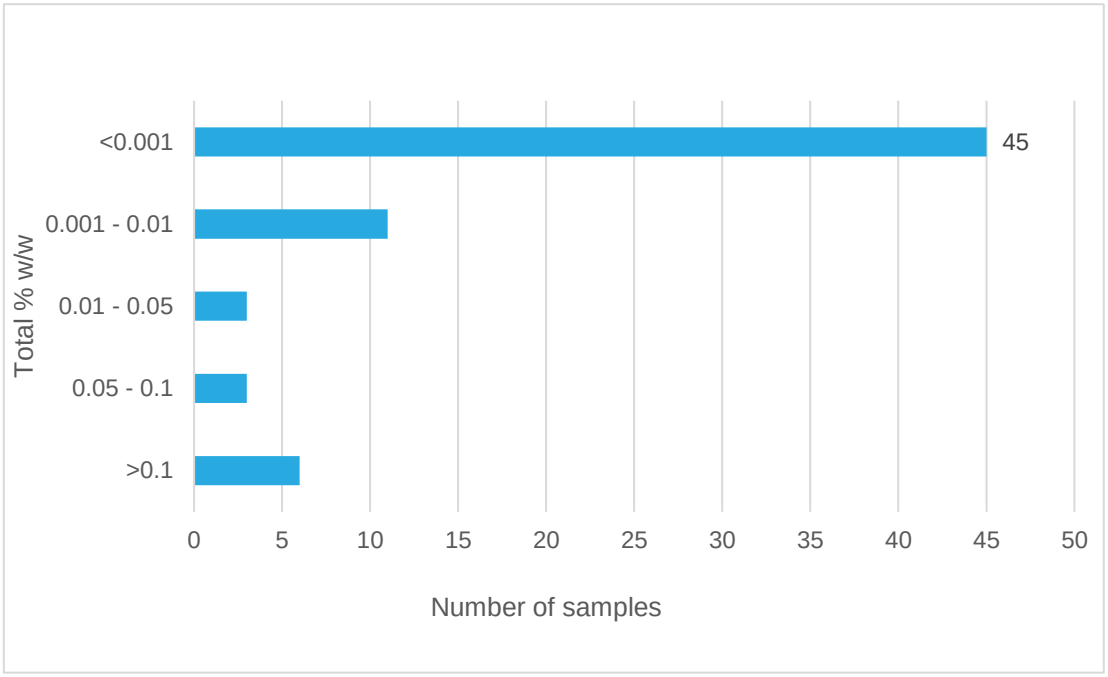
10.3.6 Asbestos was detected in all eras of waste **(see Table 10.7),** indicating its extensive use in products throughout the period of filling at the landfill. The highest fibre contents were seen in the 1960-1970 waste.

Table 10.7 Asbestos detections and fibre content by era of waste

Waste Era	No of samples	No. with asbestos fibres detected	% of detections	Min (%w/w)	Max (%w/w)
Pre 1947	7	3	43%	0.0037	0.963
1947-1955	7	2	29%	<0.001	0.001
1955-1960	17	2	12%	<0.001	0.0856
1960-1970	43	11	26%	<0.001	6.93
1970-1980	244	52	21%	<0.001	0.953

10.3.7 The results of the quantification analysis indicated that the asbestos fibre content was generally <0.001% (46 out of 68 samples). Only six samples had asbestos fibres content above the hazardous waste threshold of <0.1%. The results of the quantification analysis from the GIs is shown in **Drawing 13.**

Drawing 13 Total % w/w asbestos identified



10.3.8 Whilst the majority of the asbestos fibres in the soils detected were below 0.001% there are some higher results. In general, higher concentrations of asbestos in soil have the capacity to liberate higher concentrations of asbestos fibres into the air but this is also very dependent on the type of ACM present and its ability to release fibres.

Former Scrapyard

10.3.9 The former scrapyard was situated on the north western boundary of the landfill, in the location of the current Tidy Tip and is shown on aerial photography from late 1960s until early 1970s.

10.3.10 A ground investigation was undertaken in this area as part of work to examine the potential relocation of Hangar 24 (Ref. 44). During the GI 26 samples were tested for the presence of asbestos, eight samples positively identified the presence of asbestos (30% of samples). The results are shown in Table 10.8**Error! Reference source not found.**. The results of the quantification analysis indicated that the asbestos fibre content was generally <0.001%, only three were above the detection limit. Only one had asbestos fibres content above the hazardous waste threshold of <0.1 %.

10.3.11 It should also be noted that one location was terminated during the works (TP104) due to potential bundles of loose asbestos fibres at the base of the trial pit to prevent fibre release.

Table 10.8 Locations where asbestos was detected during the Hangar 24 GI (Ref. 44)

Location	Depth (m)	Asbestos detected	Form	Quantification (%w/w)
TP101	1.10	Chrysotile	Small bundles of fibres	<0.001
TP102	0.90	Amosite & Chrysotile	Bundles of fibres	0.008
			Cement	0.369
TP104	0.30	Amosite	Bundles of fibres	< 0.001
TP104	2.60	Chrysotile & Crocidolite	Cement	n/a
TP105	1.30	Chrysotile	Bundles of fibres	0.001
TP107	0.90	Amosite	Bundles of fibres	< 0.001
BH103	1.00	Amosite	Small bundles of fibres	<0.001

10.3.12 The nature of the asbestos encountered in the area of the former scrapyard appeared to be different from that encountered within the landfill, no visible bundles of fibres were noted in the landfill during the GI.

10.3.13 The presence of asbestos appears to be limited to the bunds on the boundary of the Tidy Tip site. Demolition or possible landfill type materials (including bricks, concrete, metal and plastic) were evident in all of the samples recording positive results. Based on a review of historical aerial photographs the material within the bund appears to have originated from the scrapyard.

Risk from Asbestos

10.3.14 Due to the nature of the works to be undertaken within Area A i.e. extensive excavation and the detection of some higher concentrations of asbestos fibres in the GIs, further assessment is required. The further assessment has been considered as part of a DQRA to understand whether specific remediation is required to address this risk prior to construction works.

Airport Access Road

10.3.15 Asbestos testing was undertaken on 53 samples across the route and asbestos fibres were confirmed to be present in 7 samples of Made Ground. The asbestos was generally in the form of chrysotile fibres with one occurrence of amosite fibres and amosite board. Four samples were measured to have a concentration of <0.001%, two samples with a concentration of 0.002% and one sample with 6.622%. No asbestos containing materials were recorded as part of the investigative works.

10.3.16 The distribution of the detected samples was typically limited between Dairyborn Escarpment/Airport Way and Percival Way/Presidents Way. A summary of detected asbestos is presented in **Table 10.9.**

Table 10.9 Locations where asbestos detected along the route of Airport access Road

Area	Location	Depth (mbgl)	Asbestos Type	Asbestos Identification	Asbestos Quantification	Site observations
Percival Way / Presidents Way	PFWS10	1.00	Loose Fibres	Chrysotile	<0.001	No visual ACM
	PFWS12	0.20	Loose Fibres	Chrysotile	<0.001	No visual ACM
	PFWS12	1.00	Loose Fibres	Chrysotile	0.002	No visual ACM
Dairyborn Escarpment/ Airport Way	PFCP60	0.30	Loose Fibres	Amosite	<0.001	No visual ACM
	PFWS41	1.50	Board (Loose Fibres)	Amosite	6.622	No visual ACM
	PFWS44	0.50	Loose Fibres	Chrysotile	0.002	No visual ACM
	PFWSHH01	0.50	Loose Fibres	Chrysotile	<0.001	No visual ACM

Risk from Asbestos

10.3.17 The greatest potential risks from asbestos will be during enabling and construction works, when soils are disturbed and may allow fibres to be released into ambient air. Further consideration of the potential risks from asbestos fibres should be undertaken at the detailed design stage to inform the risks to construction workers. The likely classification of works under the Control of Asbestos Regulations (Ref. 43) and risks to construction workers will need to be assessed using CL:AIRE's Joint Industry Working Group (JIWG) Decision Tools (Ref. 45) prior to any works.

10.4 Area A- PCBs

10.4.1 Using the PCDD, PCDFs and dioxin-like compounds worksheet for a commercial land use scenario a HI was derived for Area A. The spreadsheets are provided in **Appendix E**. The HI for each of the samples is presented below in **Table 10.10.** None of the concentrations had a hazard index greater than 1.0 indicating that the concentrations are unlikely to pose a risk to future users of the site.

Table 10.10 Derived Hazard Index (HI) for PCDD, PCDF and dioxin like compounds in soils.

Location	Depth (mbgl)	Hazard Index (HI)
LFBH02	6.0	0.00
LFBH04	5.5	0.07

11 GROUND GAS RISK ASSESSMENT

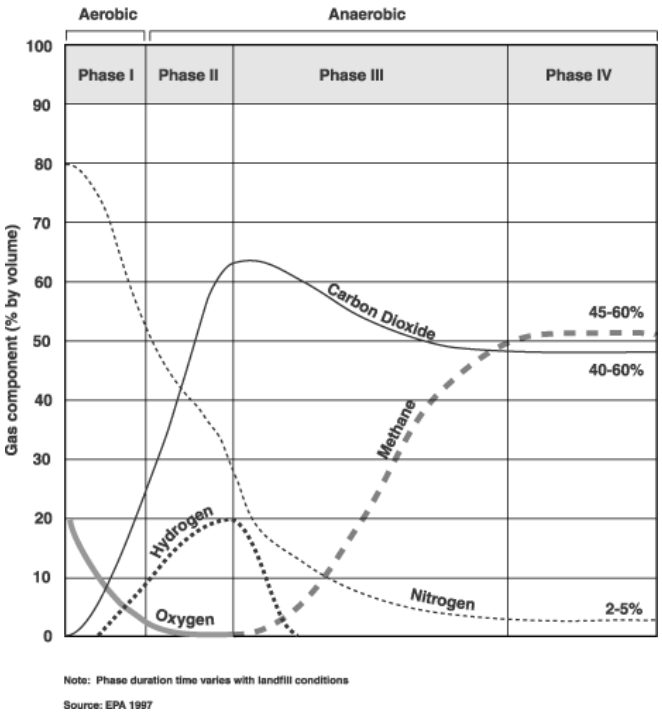
11.1 Introduction

11.1.1 There is known to be methane, carbon dioxide and potentially other trace gas present within Area A due to its former use as a landfill.

11.1.2 Landfill gas is a complex mixture of gases created by the action of microorganisms within a landfill. The volume that a landfill gases depends on its age, the decomposition status of the waste and the types of waste within it. Generally, more recently buried waste will produce more gas than older waste. Landfills usually produce appreciable amounts of gas within 1 to 3 years. Peak gas production usually occurs 5 to 7 years after wastes are dumped. Almost all gas is produced within 20 years after waste is dumped; however, small quantities of gas may continue to be emitted from a landfill for 50 or more years. The phases of landfill gas generation are shown in **Drawing 14.**

11.1.3 By volume, landfill gas typically contains 45% to 60% methane and 40% to 60% carbon dioxide. Landfill gas also includes small amounts of nitrogen, oxygen, ammonia, sulphides, hydrogen, carbon monoxide, and nonmethane organic compounds (NMOCs) such as trichloroethylene, benzene, and vinyl chloride.

Drawing 14 Phases of gas generation in a landfill



11.1.4 Significant depths of Made Ground have been recorded in certain areas of the Airport Access Road. However, the proposed access road does not include any buildings, as such there is no potential for accumulation of vapours or gases in indoor air. However, further GI and/or assessment

may be required at the detailed design stage to inform the risks to construction workers and future maintenance workers.

11.1.5 Other areas of Made Ground across the wider airport site may also be a potential source of ground gases, however these are considered to be less significant than the landfill. Therefore the following sections provide an assessment of Area A only.

11.2 Methodology

11.2.1 Current UK guidance on the monitoring of ground gas emissions, the associated assessment of risk and the implications for the design of new development is contained in the following principal documents:

a. CIRIA C665 2007, Assessing risks posed by hazardous ground gases to buildings (Ref. 46); and

b. British Standard, BS 8485:2015+A1:2019, Code of practice for the design of protective measures for methane and carbon dioxide ground gases for new buildings (Ref. 47).

11.2.2 In addition, reference has been made to the following document in order to inform the design of the gas monitoring regime:

a. Chartered Institute of Environmental Health (2008) The Local Authority Guide to Ground Gas (Ref. 28).

11.2.3 The results of the spot gas monitoring were assessed using the classification system presented within CIRIA C665 (Ref. 46) for Situation A, to provide an indication of the gassing regime at the site. The classification system uses gas concentrations and recorded flow rates for methane and carbon dioxide to determine a gas screening value (GSV). The GSV is calculated by multiplying the maximum recorded flow rate (l/hr) against the maximum recorded gas concentration (%) from all individual wells across the site to determine a value reflecting the 'worst credible' scenario. The GSV is used to determine a Characteristic Situation (CS) for the site. The CS is a qualitative method of defining the risk to a proposed development constructed on gassing ground. The CS ranges from 1 to 6, where 1 is very low risk and 6 is very high risk. The characteristic situations are shown below in **Table 11.1.**

Table 11.1 Characteristic situations used in ground gas assessment (Ref. 46)

CS (CIRIA 665)	Risk classification	Gas screening value (CH_4 or CO_2) (l/h)	Additional factors	Typical source of generation
1	Very low risk	<0.07	Typically CH_4 not to exceed 1 percent by volume and /or CO_2 not to exceed 5 percent by volume	Natural soils with low organic content

CS (CIRIA 665)	Risk classification	Gas screening value (CH_4 or CO_2) (l/h)	Additional factors	Typical source of generation
			otherwise consider increase to CS 2	"Typical" made-up ground
2	Low risk	<0.7	Borehole air flow rate not to exceed 70 l/hr otherwise consider increase to CS3	Natural soil, high peat/organic content
3	Moderate risk	<3.5		Old landfill, inert waste, mineworking flooded
4	Moderate to high risk	<15	Quantitative risk assessment required to evaluate scope of protective measures	Mineworking-susceptible to flooding, completed landfill.
5	High risk	<70		Mineworking unflooded inactive with shallow workings near surface
6	Very high risk	>70		Recent landfill site

11.2.4 The CIRIA C665 guidance document (Ref. 46) and Local Authority Ground Gas Guidance (Ref. 48) details the monitoring requirements for the period and frequency of monitoring for a low sensitivity (commercial) development with a high source gas generation potential. The requirements have been met as follows:

a. **Monitoring frequency** - the requirements detailed in CIRIA 665 are 12 monitoring occasions over a 12 month period with at least two sets of readings at low and falling atmospheric pressure (but not restricted to periods below <1,000 mb). The current spot monitoring data alongside the continuous monitoring data obtained during 2018 is considered sufficient to meet the requirements of CIRIA C665 and to inform the design of ground gas protection measures;

b. **Number of monitoring points within the landfill**- the requirements for number of monitoring points, frequency and duration of ground gas monitoring is detailed in a number of best practice guidance documents including CIRIA 665 and Local Authority Ground Gas Guidance. For older domestic landfills (moderate hazard potential) and low sensitivity of end use it details a spacing of 25-75 m spacing. The higher end of the spacing was adopted as continuous monitoring techniques, in

conjunction with conventional spot sampling give additional confidence in the ground gas regime. The 75 m spacing across 450,000 m^2 site is equal to 80 locations. 24 locations were undertaken in the preliminary GI and 55 locations during the detailed GI. A mixture of deeper (boreholes) and shallow locations (window samples) has been undertaken to profile the gassing occurring in the waste;

c. **Number of boundary monitoring points** - **Table 5.2** in the Local Authority ground gas guidance details recommended range of typical borehole spacing for boundary monitoring to assess off-site conditions. For fissure or fracture flow dominated permeable strata (for example blocky sandstone or igneous rock) and development within 150 m, the borehole monitoring spacing should be 5-20 m. A range of spacing has been used around the boundary depending on the proximity and sensitivity of the land use. Full details area provided in the GI strategy (Arup (2018)). The number of locations undertaken during the GIs meets the requirements of the guidance.

11.3 Results

Area A -Landfill

11.3.1 Gas measurements were taken from all monitoring wells installed within the landfill waste as follows:

a. Boreholes installed as part of 2016 Airport Access Road GI (Ref. 8) monitored on up to 8 occasions between October and November 2016;

b. Boreholes installed as part of 2017 landfill GI (Ref. 6) monitored on up to 4 occasions in 2017 and up to 12 monthly rounds between April 2018 and March 2019;

c. Boreholes installed as part of 2018 GI monitored on up to 6 occasions over a 3 month period following installation (Ref. 44); and

d. Continuous gas monitoring in 4 wells between August and October 2018 (Ref. 44).

11.3.2 Only the spot monitoring results have been considered in this GQRA. The continuous gas monitoring has been as part of a DQRA (Ref. 49) for Human Health, **Appendix 17-3** of the PEIR.

11.3.3 The analysis shown in **Table 11.2** and **Figure 17** indicates that the majority of gas spot monitoring results were considered to be CS2 with a few CS3 readings. The CS3 readings recorded were as a result of negative flow rates, which were considered to be a positive flow rate for the purposes of the initial assessment. Negative flow rates indicate that the gas pressures within the ground are below that of atmospheric pressure and can occur due rapid changes in atmospheric pressure. It is noted from the monitoring results that in many instances the negative flow rate was only recorded on initial opening of the gas tap. The effect of atmospheric pressure on the gas regime is more accurately measured with continuous gas monitoring. The detailed assessment of the effect of

atmospheric pressure and the gas regime of the site has been further considered as part of a DQRA.

11.3.4 The full gas results are presented in **Appendix F.**

Table 11.2 Ground gas assessment summary within landfill waste

Location	Maximum Recorded Value			GSV Methane (l/hr)	GSV Carbon Dioxide (l/hr)	Characteristic Situation (CS)

[1] Well monitored on up to 8 occasions October 2016 to November 2016
[2] Maximum flow rate recorded was a negative pressure. For purposes of this assessment the flow rate was assumed to be positive pressure for a conservative initial assessment
[3] Well monitored on up to 4 occasions in 2017, and on up to 12 monthly rounds between April 2018 and March 2019
[4] Characteristic Situation increased to CS2 based on elevated methane and/or carbon dioxide concentrations due to presence of potential high risk gas source.
[5] Well monitored on up to 4 occasions February to May 2017
[6] Well monitored on up to 6 occasions August to October 2018
[7] Well monitored on up to 7 occasions January to March 2019
[8] Continuous gas monitoring for 12 weeks between August and October 2018

Outside landfill

11.3.5 Outside of the landfill includes perimeter wells and monitoring wells along the proposed Airport Access Road alignment. The concentrations of gas recorded are low, with the general exception of BWS203, BWS211, BWS214, BBH209, BBH210 and LF-BH05G, which are all located adjacent to the landfill boundary. LF-BH05G and BBH210 are located within an area which has a significant thickness of Made Ground. Flow rates across the holes were low. The analysis shown in **Table 11.3** indicates that the area outside the landfill ranges from CS1 to CS2, which is considered low risk, although care should be taken during the design and construction phases of the development to ensure that no preferential pathways are created.

[1] Well monitored on up to 6 occasions August to October 2018

[2] Characteristic Situation increased to CS2 based on elevated CH4 and/or CO2 concentrations due to presence of potential high risk gas source.

[3] Maximum flow rate recorded was a negative pressure. For purposes of this assessment the flow rate was assumed to be positive pressure for a conservative initial assessment

[4] Well monitored on up to 4 occasions in 2017, and on up to 12 monthly rounds between April 2018 and March 2019

[5] Well monitored on up to 6 occasions October 2017 to January 2018

[6] Well monitored on up to 8 occasions January to March 2017

[7] Well monitored on up to 5 occasions October to December 2016

[8] Well monitored on up to 5 occasions November 2016 to May 2017

[9] Wells monitoring on up to 9 occasions October to November 2016

[10] Wells monitored on up to 4 occasions November 2014 to February 2015

12 CONTROLLED WATERS GENERIC QUANTITATIVE RISK ASSESSMENT

12.1 Methodology

12.1.1 The potential pollution risks to controlled waters have been assessed in accordance with the Environment Agency's Remedial Targets Methodology (RTM) (Ref. 50).

12.1.2 The first stage of risk assessment comprises an initial screening of the contaminants to identify those which are at concentrations above screening criteria and warrant further detailed investigation. The landfill site is considered to be the main source of potential contamination within the Main Application site.

Area A

12.1.3 The most sensitive controlled water receptor is considered to be groundwater within the chalk principal aquifer which is abstracted for public water supply. The nearest abstraction is located at Kings Walden 1.5km northeast of the Main Application Site boundary (approximately 2.8 km from the boundary of the landfill). A private water supply abstraction well is located at approximately the same distance as the Kings Walden abstraction, to the north east and a second private groundwater abstraction within the Mimram catchment is 1.5km south east of the Main Application Site. The nearest surface waterbody down-gradient of the landfill is the River Mimram 6 km to the southeast. As the river is a considerable distance from the site it has not been considered to be a receptor.

12.1.4 The GQRA has considered available contaminant data (soil and leachate) from within the landfill waste and groundwater data from the chalk aquifer.

Airport Access Road

12.1.5 No groundwater sampling or soil leachate testing was undertaken as part of the GI on the proposed New Road. It is not envisaged that the proposed earthworks will interact with the groundwater which is approximately 40m bgl. However, this will need to be reviewed at the detailed design stage. Therefore no further assessment is required for controlled water risks this stage.

12.1.6 The drainage strategy for the road will also be undertaken at the detailed design stage but it should ensure that no infiltration will occur across the landfill area or in other areas of Made Ground along the alignment.

Groundwater assessment

12.1.7 The screening criteria used for assessing the data, and for deriving remedial targets, were based on published water quality guideline values. As the chalk aquifer is used for public water supply, UK Drinking Water Standards (DWS) were used. Where DWS have not been derived for

certain contaminants the following hierarchy was followed when selecting suitable screening criteria:

a. Freshwater EQS (FEQS);
b. World Health Organisation (WHO); and
c. United States Environmental Protection Agency (USEPA)

12.1.8 In some cases, no standard was available, therefore a substitute screening value from the same group of contaminants with similar or higher mobility in groundwater was applied. Justification for all of the screening values used in the controlled waters assessment are provided in **Appendix G**

12.1.9 The available groundwater data which has been screened as part of this GQRA is summarised in **Table 12.1.**

Table 12.1 Data used in GQRA to assess contaminants in groundwater in the chalk **(see Figure 9 and 10 for locations)**

Data	Source	Purpose
Groundwater beneath the landfill (Mimram catchment)	2017 and 2018 GI and long-term monitoring data	Groundwater quality in the chalk aquifer directly beneath the landfill has been assessed to determine if there is any evidence of impact to groundwater as a result of leaching of contaminants from the landfill
Groundwater upgradient of the landfill (Mimram catchment)	Data from GW201 and GW202 monitored as part of 2018 GI	To provide background groundwater quality and assess if there is evidence of contaminant migration within the chalk from off-site sources
Groundwater down-gradient of the landfill (Mimram catchment)	2017 and 2018 monitoring data from wells installed to east and southeast of the landfill site	To assess if there is evidence of any significant migration of contaminants down gradient which could be attributed to the landfill or wider airport area.
Groundwater from wider airport site (Lee catchment)	Concept 2015 and MPT 2017 GI monitoring data	Not used in GQRA but has been used to inform background quality measurements in the wider area (see **Table 6.2).** Limited groundwater sampling beneath the wider airport area was undertaken during 2015 and 2017. The landfill site lies within the Mimram catchment and therefore the data from this catchment is considered the most representative to assess the potential impacts of the landfill

Soil, soil leachate and leachate assessment

12.1.10 In addition to the groundwater data, the following has also been assessed:

a. the soil/ landfill waste chemical data to determine the potential for this material to leach to groundwater;

b. soil leachate data, which are tests undertaken to confirm the leaching potential of the soil/landfill waste material; and

c. landfill leachate and perched groundwater within the landfill collected from wells on site.

12.1.11 **Table 12.2** summarises the data used, and the methodology used to assess this data.

Table 12.2 Data and approach used in soil, soil leachate and landfill leachate assessment

Data	Source	Assessment approach
Total soil concentrations within landfill waste	2017 and 2018 GI	Data compared to soil screening values calculated from controlled waters screening criteria (see methodology in 13.1.10 below)
Soil leaching tests (10:1) within landfill waste	2017 and 2018 GI	Data compared directly to controlled waters screening criteria
Leachate quality data	Leachate monitoring wells, 2017 and 2018 GIs	
Perched groundwater quality data	Perched groundwater samples from wells located within landfill waste, 2018 GI	

12.1.12 To determine the risk to groundwater of contaminants leaching from the soil, the groundwater screening values were first converted to soil screening values using the Level 1 equation in the Environment Agency RTM re-arranged as follows:

$$Cs = Cl \times \left[\frac{Kd + (\emptyset w + \emptyset a \times H)}{P}\right]$$

Where:

Cs = soil concentration (mg/kg)

Cl = target concentration for water (mg/l)

Kd = partition coefficient (l/kg)

θw = water filled porosity (fraction)

θa = air filled porosity (fraction)

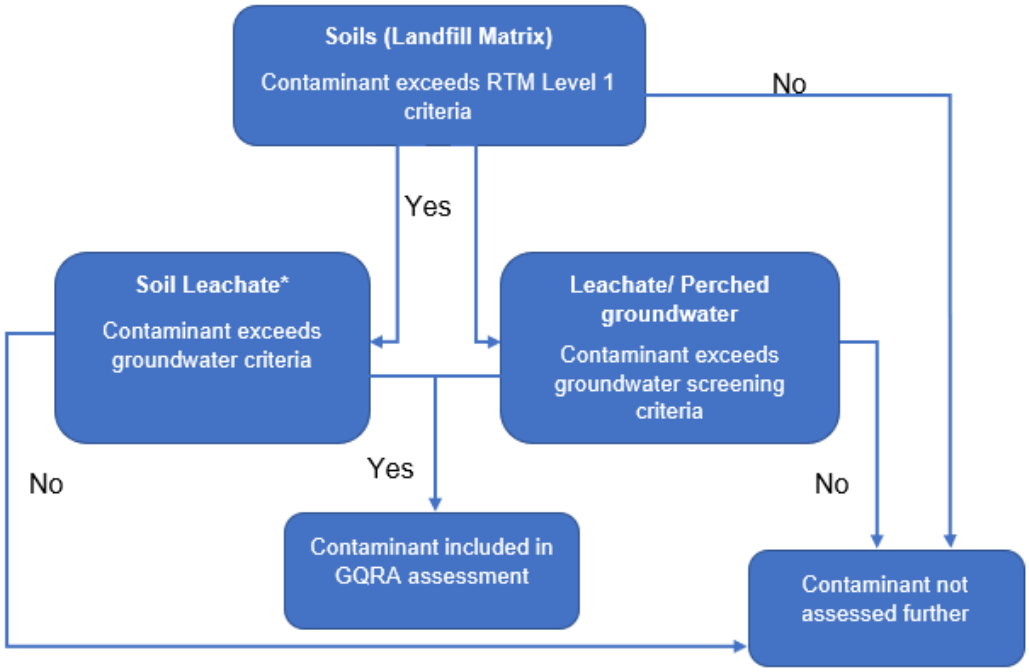
H = Henry's Law constant (dimensionless)

P = soil dry density (g/cm³)

12.1.13 The methodology follows the guidance for RTM Level 1 Soil (Ref. 50). This considers whether leaching of contaminants from the Made Ground within the landfill poses a risk to the receptor, while ignoring dilution, dispersion and attenuation along the pathway.

12.1.14 Comparison of soil concentrations to soil screening values based on theoretical calculations is conservative and concentrations often exceed the criteria. The soil leachate and leachate/perched groundwater data available is considered to be a more realistic representation of potential contaminants in the landfill which could pose a risk to controlled waters. In order to determine the key contaminants of concern for the assessment the contaminants which exceeded the RTM Level 1 values were then compared to soil leachate and leachate/perched ground. The process of selecting the key contaminants of concern is shown in **Drawing 16.**

Drawing 15 Process for selecting key contaminants of concern in the soils (landfill matrix)



*Due to the nature of the analysis, soil leachate testing is only valid for metals and inorganic contaminants

Statistical analysis

12.1.15 Statistical analysis has been used within the controlled waters GQRA in order to determine whether contaminant exceedances were considered

statistically insignificant (i.e. rare exceedance) or likely to pose a risk to controlled waters. When calculating the statistics, where concentrations were below the laboratory limit of detection (LOD) the LOD value was used.

12.1.16 The statistical analysis has been used to determine whether further assessment beyond GQRA is required for specific contaminants. The criteria for determining whether contaminants require further DQRA is in **Table 12.3.**

Table 12.3 Criteria for determine whether further controlled water assessment is required for contaminants

Criteria	Action
No samples exceed the criteria value	No further assessment required
97th percentile concentration less than criteria value	No further assessment required
97th percentile concentration less than 2x criteria value	Requires further review
97th percentile concentration less than 10x criteria value	Requires further review / likely to require DQRA
97th percentile concentration greater than 10x criteria value	Likely to require DQRA

12.2 Results

Groundwater

12.2.1 This section presents the results of the screening assessment of groundwater samples collected from the chalk principal aquifer. and the follows the guidance for RTM Level 2 Groundwater assessment. This considers an assessment of groundwater beneath the site to determine if groundwater has been impacted by contaminants which may have leached from the landfill or sourced from other parts of the airport or the wider Luton area.

12.2.2 The results of the screening assessment for contaminants within the groundwater are presented in in **Appendix G.**

12.2.3 A summary of the contaminants with concentrations exceeding the screening values within the groundwater is presented in **Table 12.4 to Table 12.8.**

Table 12.4 Summary of groundwater concentrations of **metal and organotin** contaminants which exceed the screening criteria

12.2.4 Several groundwater samples contained contaminants that exceeded the groundwater criteria both from beneath the landfill site and from adjacent areas **(see Table 12.4-Table 12.8).** The following is noted about these exceedances:

Metals, Organotins and inorganics

a. Concentrations of manganese were elevated in a number of samples directly beneath the landfill and in some samples down-gradient. Manganese can be elevated due to natural impurities in the Chalk, however as the maximum concentrations recorded in groundwater beneath the landfill are above the background concentrations it is considered that this requires further assessment.

b. Hexavalent chromium and dibutyltin were not detected in the groundwater directly beneath the landfill. However, two samples of hexavalent chromium and dibutyltin down-gradient of the landfill exceeded the screening criteria. Hexavalent chromium was detected in BH51 and BH13 on one occasion (on 14/04/2018 and 08/08/2018 respectively) all other occasions it was below limit of detection. Dibutyltin was detect in BH01 and BH13 on one occasion (both on 07/03/2017), all other occasions it was below limit of detection. Given that these contaminants are not being continuously detected, despite significant monitoring being undertaken and appear to be random spikes they are not considered significant and therefore further assessment is not required. This is in accordance with the government published groundwater protection guidance (Ref. 51).

c. Tributyltin was only detected up-gradient of the landfill on one occasion in GW201 and not in the groundwater directly beneath the landfill or

down-gradient. Therefore, the landfill is not considered to be the source of the concentrations detected at this location and further assessment is not required.

d. Mercury and selenium recorded a few marginal exceedances in the groundwater directly beneath the landfill and in the case of mercury two exceedances down gradient of the landfill. For both of these contaminants the 97th percentile concentration was less that the criteria value, indicated marginal sporadic exceedances. Therefore, further assessment of these contaminants is required.

e. Several other metals (iron and nickel and boron) recorded exceedances within groundwater directly beneath the landfill and/or down-hydraulic gradient for which the 97th percentile was greater than two times the criteria value. Therefore, these contaminants require further assessment.

f. Ammoniacal nitrogen is often found in landfill leachate and therefore the exceedances recorded in groundwater below the landfill may indicate the presence of leachate in the groundwater and therefore requires further assessment. Ammoniacal nitrogen was recorded in some wells immediately down-gradient of the landfill which suggests some migration of this contaminant may be occurring **(see Figure 18).** Therefore, this contaminant requires further assessment.

g. Nitrate and nitrite are present in the groundwater both beneath the landfill and down-gradient. These are compounds which can occur naturally, but can also be present in elevated concentrations due to anthropogenic sources and the decomposition of organic material in soils. Ammoniacal nitrogen also oxidises to form nitrate and nitrite. These compounds can therefore be both an indicator of the presence of landfill leachate, and be common in agricultural areas. The concentrations of nitrate recorded beneath the landfill may indicate the presence of landfill leachate, however the concentrations down-hydraulic gradient show minimal impact. Therefore this contaminant requires further assessment.

h. Marginal exceedances of both chloride and sulphate were recorded below the landfill, however the exceedances were only in a low number of samples and therefore further assessment is not considered necessary.

i. Two exceedances of thiocyanate were noted in groundwater below the landfill and two down-gradient. The exceedances were noted in different locations on individual monitoring rounds, all other occasions it was below limit of detection. Given that thiocyanate is not being continuously detected, and significant monitoring has been undertaken, the detections appear to be random spikes and are not considered significant and therefore further assessment is not required.

Petroleum hydrocarbons, PAHs, Phenols, VOCs and SVOCs

a. TPH Aliphatic >C21-C35 was detected in groundwater directly beneath the landfill in GW206 on two occasions (13/02/2019 and 07/03/2019), it was not detected in any of the subsequent monitoring rounds. No other TPH fractions were detected in the groundwater beneath the landfill. Guidance on hydrocarbons in groundwater indicates that TPH Aliphatic C21-35 has a very low mobility in groundwater (Ref. 52.) This is supported by the fact it was not detected in groundwater down-gradient of the landfill. Given that it is not being continuously detected, despite significant monitoring being undertaken and it has very low mobility in groundwater the exceedances are not considered significant and no further assessment is required.

b. Exceedances of TPH Aromatic >C16-21 and >C21-35 were recorded in samples obtained from the up-gradient background wells but not in groundwater directly beneath the landfill, which indicates there may be a localised off-site source of TPH. Therefore, the landfill is not considered to be the source of these exceedances and further assessment is not required.

c. Elevated concentrations of phenol and several PAH compounds (benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, benzo(g,h,i) perylene) were detected with 97th percentile concentration greater than two times the assessment criteria in up-gradient wells. These compounds were not detected above the assessment criteria in groundwater beneath the landfill, indicating that there may be a localised off-site source impacting groundwater. Therefore, the landfill is not considered to be the source of these exceedances and further assessment is not required.

d. Fluoranthene was detected in seven groundwater samples beneath the landfill, with the 97th percentile concentration exceeding the assessment criteria by at least two times. This contaminant was also detected at elevated levels downgradient. Therefore, further assessment of this contaminants is required.

e. Trichloroethene (TCE) and its breakdown products, 1,2-dichlroethane and vinyl chloride, were detected above the screening criteria in several samples directly beneath the landfill, with the 97th percentile concentration exceeding the assessment criteria by at least two times. Low levels of TCE, but none of the breakdown products, have been recorded in groundwater down-gradient of the landfill (CP-BH55). Therefore, further assessment of this contaminant is required.

f. Bis(2-ethylhexyl)phthalate is not considered to require further assessment as there was only one exceedance and the 97th percentile concentration did not exceed the assessment criteria. Therefore the exceedance is not considered significant and no further assessment is required.

PFAS

a. Concentrations of perfluorooctane sulfonic acid (PFOS) and perfluorooctanoic acid (PFOA) have been recorded above the laboratory limit of detection in a number of groundwater samples obtained from the site. Both PFOS and PFOA are two of the most abundant substances of a group of contaminants known collectively as poly and perfluorinated substances (PFAS).

b. Historically PFAS was manufactured for a wide range of industrial, commercial and household applications. PFAS were common components of fire-fighting foams and are commonly encountered at airports, military sites, fire training areas and other large industrial facilities [49] The use of fire-fighting foam products containing >0.001 %wt PFOS was banned in the EU in June 2011. Disposal to landfill is often the end life cycle for consumer products that contain PFAS and household wastes in landfill such as carpets, textiles and clothing can contribute as a source. Additionally, industrial waste can be a significant source in landfills and landfill leachate (Ref. 53).

c. The highest concentrations of PFOS recorded in groundwater have typically been in groundwater wells which are located close to the airports fire training facility. It is understood that the airport does not use fire-fighting foams which contain PFAS and therefore it is likely that the presence of PFAS in groundwater is a result of historic use of fire-fighting foams at the airport and from other industrial sites across the wider Luton area.

d. Samples have been compared to assessment criteria recently published by the Drinking Water Inspectorate (Ref. 54) which include a tiered assessment. As the tiers increase, the onus of the minimum action to be taken increased.

e. Tier 1 is a qualitative assessment based where PFAS should be considered a hazard. Tiers 2 to 4 provide a drinking water guidance value to assess concentrations against.

f. Minor exceedances of Tier 2 guidance values are observed upgradient of the landfill, with no further exceedances of Tiers 3 and 4 criteria. 36% of samples from groundwater beneath the landfill are recorded as above Tier 2 criteria, which reduces to 11% exceeding Tier 3 criteria. No samples are above Tier 4 criteria. 49% of samples downgradient are exceeding Tier 2 criteria which reduces to 22% exceeding Tier 3 criteria. No exceedances of Tier 4 criteria are observed.

g. The minimum action to be taken as recommended by the DWI for Tier 2 exceedances is additional monitoring to establish long term trends and risks. Minimum actions recommended by the DWI for Tier 3 exceedances is to consult with appropriate persons to reduce concentrations as soon as is practicable.

h. It is pertinent to note that the assessment using the DWI values is considered conservative as they are applicable to treated drinking water and applying the criteria to the principal aquifer is extremely

conservative. The use of the DWI values within this report is to provide an indicative risk. As the majority of exceedances are values between Tier 2 and Tier 3, the risk to controlled waters is considered to be low. Therefore, at this stage PFAS have not been taken forward to DQRA. However, there is work ongoing by the Environment Agency to understand the risks and develop pragmatic approaches to PFAS assessment. Further monitoring and assessment will be required based on the assessment to date. Although monitoring suggests that the risk with respect to PFAS is low at the development site they should be considered contaminants of concern until the guidance is available and any further assessment work completed.

Pesticides

a. A number of pesticides have been recorded within the groundwater, however the exceedances are generally localised and typically only marginally above the screening criteria. The sources of pesticides within the groundwater are likely to have arisen from a number of sources including agricultural application across the wider development site. More frequent exceedances of mecoprop and diuron have been recorded in groundwater beneath the landfill and are therefore considered to require further assessment.

12.2.5 Overall relatively few exceedances of potential contaminants of concern have been recorded in groundwater beneath the site. Those which did exceed tended to be in boreholes beneath or close to the landfill and were typically in localised areas. There is limited evidence of any significant contaminant plume migrating down-hydraulic gradient of the landfill.

12.2.6 The following contaminants of concern **(Table 12.9)** have been identified in the groundwater which exceed the screening criteria and are considered to potentially pose a risk to controlled waters receptors and should therefore be further assessed. The maximum concentrations of these contaminants recorded in the groundwater monitoring wells is shown on **Figure 18.**

Table 12.9 Summary of contaminants of concern within groundwater requiring further assessment

Contaminants of Concern
Metals and Inorganics
Manganese
Ammoniacal nitrogen
Nitrate
Boron
Iron
Nickel
Petroleum hydrocarbons, PAHs, Phenols, VOCs and SVOCs
Fluoranthene

Contaminants of Concern
Metals and Inorganics
Trichloroethene (TCE)
Vinyl chloride
1,2-dichloroethane
Pesticides
Diuron
Mecoprop

Soil, soil leachate and leachate

12.2.7 Comparison of the total soil concentrations to RTM Level 1 values indicated a large number of exceedances. The contaminants where the maximum value exceeded the RTM by at least 100 times are summarised in **Table 12.10**. The full results are provided in **Appendix G.**

Table 12.10 Contaminants in the soil (landfill matrix) for which the maximum value exceeded the RTM Level 1 values by at least 100 times

12.2.9 The GQRA indicated that the following contaminants in the matrix of the landfill may pose a risk to controlled waters:

Metals and inorganics

a. Antimony, arsenic, barium, boron, iron, manganese and nickel were found to be potentially leachable and/or to be present in elevated concentrations in leachate/perched groundwater. While a number of these metals are known to be found naturally in groundwater within the chalk, the concentrations recorded exceed the typical background values and those recorded on site up-gradient of the landfill. A number

of these contaminants were also detected in elevated concentration in the groundwater beneath the landfill **(see Section 12.2.4).** Therefore, these contaminants require further assessment;

b. A number of metals contaminants (lead, molybdenum, selenium and vanadium) were found to exceed the screening criteria in soil leachate. Lead, molybdenum and vanadium were not detected in the groundwater above the assessment criteria and selenium only exceeded in one sample but the 97th percentile was below the assessment criteria **(see Section 12.2.4).** As such there is not considered to be a significant source of these contaminants in the landfill which could pose a risk to controlled waters and therefore no further assessment is required;

c. Concentrations of hexavalent chromium were elevated in one leachate and one soil leachate sample, however all other results were below the laboratory limit of detection. Hexavalent chromium was also not continuously detected in groundwater **(see Section 12.2.4 above),** despite significant monitoring being undertaken, with only random spikes detected. As such there is not considered to be a significant source of hexavalent chromium in the landfill which could pose a risk to controlled waters and therefore no further assessment is required;

d. Tributyltin compounds were elevated in five samples of perched groundwater but not within the soil leachate or leachate samples. Elevated concentrations recorded in BWS217 and BH214 were only recorded in these wells on one occasion with other samples being below the laboratory LOD. Dibutyl tin was also only elevated in two samples of perched groundwater and in BH209 was below LOD in a second sample. Neither of these contaminants were detected above LOD in the groundwater beneath the landfill **(see Section 12.2.4).** As such there is not considered to be a significant source of these contaminants in the landfill which could pose a risk to controlled waters and therefore no further assessment is required.

e. Sulphate, fluoride, bromate and total cyanide exceeded the assessment criteria. None of these contaminants were detected above assessment criteria in the groundwater beneath the landfill. As such there is not considered to be a significant source of these contaminants in the landfill which could pose a risk to controlled waters and therefore no further assessment is required.

f. Nitrite only has one exceedance within the soil leachate and the 97th percentile concentration did not exceed the assessment criteria. Therefore the exceedance is not considered significant and no further assessment is required.

g. Ammoniacal nitrogen was found to have elevated concentrations throughout the landfill. Ammoniacal nitrogen is a typical component of landfill leachate and therefore is considered a potential contaminant of concern. Further assessment of ammoniacal nitrogen is required.

h. A number of samples recorded elevated concentrations of thiocyanate. Thiocyanate is typically produced from the reaction between free cyanide and sulphate and can occur in landfills with a significant component of industrial waste. Thiocyanate is generally considered to be less toxic than cyanide. Thiocyanate was also detected in the groundwater beneath the landfill but not down-gradient **(see Section 12.2.4).** Thiocyanate is considered to require further assessment to determine whether the concentration could pose a risk to controlled waters.

Petroleum hydrocarbons, PAHs, Phenols, VOCs and SVOCs

a. Petroleum hydrocarbon aliphatic and aromatic fractions TPH C12-C16, C16-C21 and C21-35 are considered to present a potential risk to controlled waters. Several samples have reported maximum concentrations which are close to or above solubility limits which suggests the presence of free phase product, these wells (BH231, BH223 and WS224) are all located within the south east of the current LTCP and may indicate the presence of localised product within the landfill waste. A hydrocarbon sheen was present on groundwater sampled from WS224. While only a small number of samples recorded an elevated concentration of xylene, the maximum concentrations of benzene and xylene were significantly above the screening criteria and should also be assessed further.

b. Petroleum hydrocarbon aliphatic and aromatic fractions TPH >C8-C10, and>C10-C12 are not considered to pose a risk to controlled waters as elevated concentrations were only recorded on up to two occasions. In addition, neither of these fractions were detected above assessment criteria in the groundwater beneath the landfill. As such there is not considered to be a significant source of these contaminants in the landfill which could pose a risk to controlled waters and therefore no further assessment is required.

c. Phenol and cresols were only elevated in three leachate samples and are therefore considered unlikely to pose a risk to controlled waters. Neither of these contaminants were detected above assessment criteria in the groundwater beneath the landfill. As such there is not considered to be a significant source of these contaminants in the landfill which could pose a risk to controlled waters and therefore no further assessment is required.

d. Widespread elevated concentrations of PAHs were recorded in both the leachate and perched groundwater. For further assessment benzo(a)pyrene, naphthalene, fluoranthene and anthracene will be considered as these are considered as representative marker compounds for the other PAHs.

e. Several VOC and SVOC compounds have been recorded above the screening criteria, however most have been isolated occurrences with the majority of results recording concentrations below the laboratory

limit of detection. 1,2,4-trimethylbenzene exceeds in a several samples and is therefore considered to require further assessment.

PFAS

a. Elevated concentrations of PFAS were recorded in both the perched groundwater within the landfill and within the leachate throughout the duration of the monitoring. Whilst exceedances of PFAS have been observed within the leachate and groundwater perched within the landfill, the detections in groundwater beneath the **landfill (see Section 12.2.4)** are not as significantly elevated. Whilst the landfill should be considered a source of PFAS, monitoring data suggests that the impact to controlled waters is low. As discussed in **Section 12.2.4** the Environment Agency are currently developing a pragmatic approach to PFAS assessment. PFAS should be considered a contaminant of concern until the guidance is available and additional monitoring will be required.

Pesticides

a. A number of pesticides have been recorded within the leachate and perched groundwater, however the exceedances are localised, with the exception of mecoprop where more frequent exceedances have been recorded and requires further assessment. It is noted that all of the pesticides detected within the landfill are no longer in use in the UK (Ref. 50).

12.2.10 The following contaminants of concern within the landfill **(Table 12.16)** exceed the screening criteria and are considered to potentially pose a risk to controlled waters and should therefore be further assessed. The locations of these exceedances within the landfill are shown in **Figure 18.**

Table 12.16 Summary of contaminants of concern within landfill requiring further assessment

Metals and Inorganics	
Antimony	Iron
Arsenic	Manganese
Barium	Ammoniacal nitrogen
Boron	Nickel
Thiocyanate

Mecoprop	

13 REVISED CONCEPTUAL SITE MODEL

13.1 Introduction

13.1.1 The preliminary conceptual site model detailed in **Section 3** has been updated following the quantitative risk assessment. The same methodology as detailed in DCO PRA (Ref. 1) has been used for assessing the risk.

13.1.2 The revised CSM takes into account the understanding of the ground model which is presented in **Section 7** and the landfill waste characteristics and quantitative assessments described in **Sections 8 to 12.** The updated CSM is provided in **Table 13.1** Revised Conceptual Site Model (CSM) updated following GQRA for Area A(Area A) and **Table 13.2** (Airport Access Road). The CSM for Area A is shown in **Figure 19.**

13.1.3 It has been indicated within **Table 13.1** whether the PCLs apply either:

a. During excavation, remediation and construction phase; or

b. Future use of proposed development

13.1.4 In addition, the PCLs have been classified as follows:

	Confirmed relevant pollutant linkage (RCL) require inclusion in the Remediation Strategy
	PCL requires further consideration through Detailed Quantitative Risk Assessment (DQRA)
	Impact is possible but can be mitigated by design and/or managed under an alternative regime such as permitted operation or occupational safety. Measure should be included in the Remediation Strategy.
	Impact ruled out no further assessment required

Table 13.1 Revised Conceptual Site Model (CSM) updated following GQRA for Area A

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
1	DEV	Ground gases from former landfill e.g. methane	Migration into future buildings and build-up of gases	Users of future development – public/airport operatives/ New Century Park users	Very High	The GQRA indicated that the Characteristic Situation is 2 to 3. However, further DQRA is required to understand the gassing conditions.
2	DEV		Migration off-site	Adjacent site users (e.g. residential housing and other buildings on Luton Airport, WVP Community Centre/ pavilion)	Moderate	The GQRA indicated little evidence of off-site migration of gases. Further DQRA is required to understand the gassing conditions.
	CON					Measures will be required to treat existing preferential pathways e.g. Thames Valley Drain.
3	DEV	Volatile radionuclides occupying buildings overlying radioactive land contamination	Migration into future buildings and build-up of gases	Users of future development – public/airport operatives/ New Century Park users	Low	The recent GI included testing for radionuclides, which indicated levels observed were consistent with background levels **(see Section 10.1.3).** No further risk assessment of the radionuclide risks is required. However, a watching brief will be required during excavation works and procedures in place
4	DEV		Migration off-site through preferential pathways	Adjacent site users (e.g. residential housing and other buildings on Luton Airport, WVP Community Centre/ pavilion)	Low	

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						to ensure any suspected radionuclide containing material encountered is appropriately managed.
5	CON	Waste in former landfill	Direct contact e.g. dermal contact, soil ingestion	Construction worker	Low	Based on the results of the GQRA no special precautions, above and beyond best practice, are considered necessary during construction works to control potential acute risks. Appropriate measures should be undertaken during construction to ensure the site is secure and dusts are controlled. Any risks to construction worker can be reduced by adoption of appropriate site management protocols and PPE.
6	DEV	Waste in former landfill		Future maintenance workers	Low/ Moderate	The GQRA indicated there was very few exceedances and the risk to maintenance workers of the new airport development is low. Maintenance workers may be exposed to areas of landfill

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						waste during future excavation. This can be reduced by placing of services in a clean cover system.
7	DEV	Waste in former landfill		Users of future development – public/airport operatives/ New Century Park users	Low	The GQRA indicated there was very few exceedances and the risk to future users of the new airport development is low. The future development will comprise buildings & hardstanding, therefore there is unlikely to be any contact with landfilled wastes. However, given the heterogeneous nature of landfills and the lack of engineered cover system, it should be assumed that measures will be required, particularly in landscape areas to prevent direct contact with the waste.
8	CON		Direct or indirect contact with radionuclides – incurring	Construction workers	Low/ Moderate	Potential for radioactive materials to be present within the earlier waste which was deposited prior to the introduction of the Radioactive

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
			radiation dose by indirect dose received from ingestion of radium (or other alpha emitting contaminated material) or direct risk from contact with beta emitters such as Carbon-14 or Caesium-137			Substances Act in 1963. Potential for arisings from piling and foundation activities to encounter such materials. The recent GI included testing for radionuclides, which indicated levels observed were consistent with background levels. Procedures during construction should be in place to detect any radionuclides which may be encountered.
9	DEV	Waste in former landfill		Future maintenance workers	Low	The recent GI included testing for radionuclides, which indicated levels observed were consistent with background levels **(see Section 10.1.3).** However, given the heterogeneous nature of landfills and the lack of engineered cover system, it should be assumed that measures will be required. Maintenance workers may be exposed to areas of landfill waste during future

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						excavation. This can be reduced by placing of services in a clean cover system.
10	DEV			Users of future development – public/airport operatives/ New Century Park users	Low	The recent GI included testing for radionuclides, which indicated levels observed were consistent with background levels **(see Section 10.1.3**). However, given the heterogeneous nature of landfills and the lack of engineered cover system, it should be assumed that measures will be required, particularly in landscape areas to prevent direct contact with the waste.
11	CON		Inhalation of vapours	Construction worker	Low	There are no generic assessment criteria for assessing soil gas vapour concentrations. Therefore, PCLs associated with soil gas vapours require further DQRA.
12	DEV			Future maintenance workers	Low	

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
13	DEV			Users of future development – public/airport operatives/ New Century Park users	Low	There are no generic assessment criteria for assessing soil gas vapour concentrations. Therefore, PCLs associated with soil gas vapours require further DQRA.
14	DEV		Inhalation of airborne contaminants/ dust/ asbestos fibres and microorganisms	Users of future development – public/airport operatives/ New Century Park users	Low	Further assessment required to understand mitigation measures required with respect to asbestos fibres, considered with DQRA.
15	CON			Adjacent site users (e.g. residential housing, Luton Airport visitors and operatives, users of WVP)	High	Further assessment required to understand mitigation measures required with respect to asbestos fibres, considered with DQRA.
16	CON			Construction workers	Moderate	Further assessment required to understand mitigation measures required with respect to asbestos fibres, considered with DQRA.

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
17	CON		Driving of contaminants downward during any future piling	Principal aquifer in Chalk	Moderate	The GQRA has indicated that there are isolated hot spots of contaminants present and a localised area of free product was encountered at location WS224. Care will be required during construction not to create a pathway. This may involve localised remove of hotspots in locations where works may create a pathway. Incorporation of localised removal at select locations in remediation strategy for site to reduce potential for creation of pathways Risk from piling and construction can be mitigated by completion of piling risk assessment report to determine appropriate assessment for pile design and construction.
18	DEV		Direct contact of foundations of future development	Foundations of future buildings	Moderate	Presence of landfill waste in contact with building foundations may cause damage to foundations

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						through aggressive ground conditions. Site investigation data will be considered in the design of the foundation. Risk can be mitigated by appropriate geotechnical design to select suitable foundation materials/concrete classification.
19	CON	Japanese Knotweed	Direct contact with rhizomes on floor slabs, external pavement and drainage	Floor slabs/drainage/pavement	Moderate/ Low	Japanese Knotweed has been identified in WVP, this can cause damage to buried infrastructure/buildings and pavement through growth of rhizome. Risk can be mitigated through application of treatment with herbicide/removal/on-site burial/containment.
20	CON	Leachate in former landfill[1]	Direct contact e.g. dermal contact	Construction workers	Moderate/ Low	Construction workers may be exposed to landfill leachate during future excavation works. The GI undertaken indicates there is likely to be limited leachate present.

[1] The source of the leachate in assumed to be the landfill waste material

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						Any excavation work would adopt appropriate site management protocols and PPE.
21	DEV			Future maintenance workers	Moderate/ Low	The GI undertaken indicates there is likely to be limited leachate present. Maintenance workers may be exposed to areas of landfill waste during future excavation. This can be reduced by placing of services in a clean cover system.
22	DEV			Users of future development – public/airport operatives/ New Century Park users	Low	The GI undertaken indicates there is likely to be limited leachate present. The future development will be buildings and hardstanding and is likely to include an engineered cover layer and leachate control system, therefore there is limited potential for contact with any leachate in the landfill.
23	DEV		Downward migration of leachate	Principal aquifer in Chalk	Moderate/ Low	Further detailed risk assessment is required to inform the risks from this PCL.

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
24	DEV		Direct contact with foundations of future development	Foundations of future buildings	Moderate/ Low	Presence of leachate in contact with building foundations may cause damage to foundations through aggressive ground conditions. The GI undertaken indicates there is likely to be limited leachate present. Consider in the geotechnical design.
25	DEV		Leachate breakout and plant uptake	Areas of Landscaping in the airport and New Century Park developments/WVP allotments	Low	No evidence of leachate breakout currently occurring. The GI undertaken indicates there is likely to be limited leachate present. A clean cover system with suitable depth of growth medium will further reduce this risk.
26	CON	Contaminants in perched water	Driving of contaminants downward during any future piling	Principal aquifer in Chalk	Low	GQRA indicated that perched water was present in some locations within the landfill. The GQRA indicated that there are isolated hot spots of contaminants present and a localised area of free product. Care will be required during construction not to create a

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						pathway. This may involve localised remove of hotspots in locations where works may create a pathway. Risk from piling and construction can be mitigated by completion of piling risk assessment report to determine appropriate assessment for pile design and construction.
27	CON		Migration of contaminants via preferential pathways e.g. drainage	Principal aquifer in Chalk	Moderate	Survey and assessment of purpose of drain passing through landfill to be undertaken and incorporated into design. Measure to be incorporated in design to prevent creation of preferential pathways.
28	CON	Contaminants in Made Ground (car park, capping material)	Direct contact e.g. dermal contact, soil ingestion	Construction workers	Moderate/ Low	Based on the results of the GQRA no special precautions, above and beyond best practice, are considered necessary during construction works to control potential acute risks. Appropriate measures should be undertaken during

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						construction to ensure the site is secure and dusts are controlled. Any risks to construction worker can be reduced by adoption of appropriate site management protocols and PPE.
29	DEV	Contaminants in Made Ground (car park, capping material)		Future maintenance workers	Moderate/ Low	The GQRA indicated there was very few exceedances and the risk to maintenance workers of the new airport development is low. Maintenance workers may be exposed to areas of Made Ground during future excavation. This can be reduced by placing of services in a clean cover system and adoption of appropriate site management protocols and PPE.
30	DEV			Users of future development – public/ airport workers/users of New Century Park	Low	The GQRA indicated there was very few exceedances and the risk to future users of the new airport development is low. The future development will comprise

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						buildings & hardstanding, therefore there is unlikely to be any contact Made Ground. However, given the heterogeneous nature of landfills and the lack of engineered cover system, it should be assumed that measures will be required, particularly in landscape areas to prevent direct contact with the Made Ground.
31	CON		Inhalation of soil derived dusts/asbestos fibres	Construction workers	Moderate	Further assessment required to understand mitigation measures required with respect to asbestos fibres, considered with DQRA.
32	DEV			Future maintenance workers	Moderate/ Low	Further assessment required to understand mitigation measures required with respect to asbestos fibres, considered with DQRA.
33	DEV			Users of future development – public/ airport workers/users of New Century Park	Low	Further assessment required to understand mitigation measures required with respect to asbestos fibres, considered with DQRA.

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
34	CON			Adjacent site users (e.g. residential housing, Luton Airport, WVP)	Moderate/ Low	Further assessment required to understand mitigation measures required with respect to asbestos fibres, considered with DQRA.
35	CON		Inhalation of vapours	Construction worker	Low	There are no generic assessment criteria for assessing soil gas vapour concentrations. Therefore, PCLs associated with soil gas vapours require further DQRA.
36	DEV			Future maintenance workers	Low	
37	DEV			Users of future development – public/ airport workers/users of New Century Park	Moderate/ Low	There are no generic assessment criteria for assessing soil gas vapour concentrations. Therefore, PCLs associated with soil gas vapours require further DQRA.
38	DEV			Adjacent site users (e.g. residential housing, Luton Airport, WVP Buildings)	Low	There are no generic assessment criteria for assessing soil gas vapour concentrations. Therefore, PCLs associated with soil gas vapours require further DQRA.
39	CON		Balancing pond	Principal aquifer in Chalk	Very Low	Thames Water balancing pond present in the north of the former landfill area, it will remain in place during the

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						Proposed Development. Appropriate site management and construction techniques will be required during the development construction process in the vicinity of the current pond to reduce the risk.
40	DEV	Contaminants in groundwater (dissolved phase)	Lateral migration of contaminants in groundwater	Controlled waters (including potable water groundwater abstraction)	Moderate	Further detailed risk assessment is required to inform the risks from this PCL.
41	CON	Unexploded Ordnance	Driving of piles impact UXO	Construction workers/public/ terminal buildings	High/ Moderate	Based on Detailed UXO Risk Assessment 'Very High' probability of UXO on-site. Low risk where works are to be undertaken within post war fill material- correct detection and monitoring procedures will be required during site works to mitigate risks.

KEY:
CON- PCL during excavation, remediation and construction phase
DEV- PCL associated with future use of proposed development

Table 13.2 Revised Conceptual Site Model (CSM) updated following GQRA for Airport Access Road

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
1	CON	Contaminants in Made Ground	Direct contact e.g. dermal contact and/or ingestion	Construction workers	Low	GI has been completed across most of the area for the proposed Airport Access Road. The GQRA has indicated that the contaminant concentrations recorded do not exceed the GAC. However additional GI will be required for detailed design to address the CoC which have not been investigated. No further detailed assessment is required at this stage and no requirement for remediation has been identified. However, future excavation works should adopt appropriate site management protocol and controls identified by the appointed contractor's method statement and risk assessment (MSRA).

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
2	DEV			Maintenance workers	Low	Future workers and end users are unlikely to encounter contaminated material due to the presence of the road hardstanding which breaks any plausible exposure pathways. If excavation was required workers would adopt appropriate site management protocols and PPE
3	CON		Inhalation of soil derived dusts/asbestos fibres from the Made Ground	Construction workers	Low	Construction workers will be exposed to Made Ground during excavation/construction. The generic assessment of risk from asbestos fibres has concluded a low risk with asbestos above the LOD detected in a small number of samples. Further sampling and analysis should be completed at design stage. Any future

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						excavation work would adopt appropriate site management protocols and PPE, based on completion of a JIWG assessment, prior to any works.
4	DEV			Maintenance workers	Low	Future workers and end users are unlikely to encounter contaminated material due to the presence of the road hardstanding which breaks any plausible exposure pathways. If excavation was required workers would adopt appropriate site management protocols and PPE, identified in the MSRA.
5	DEV			Adjacent site users (e.g. commercial units, residential	Low	There is the potential for soil derived dusts which contain contaminants to be generated during construction works. asbestos fibres have been

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
				areas, Luton Airport)		recorded in Made Ground. Good site management practices and mitigation measures would reduce the potential risk, to include perimeter monitoring, detail to be included in the remediation strategy and outline CoCP.
6	CON		Inhalation of vapours	Construction worker	Very Low	Evidence of TPH odours were recorded during previous GIs, generally at significant depth. Exposure to construction workers and future maintenance workers is considered to be low as it would be in outdoor air and therefore vapours will be diluted. Future excavation works should adopt appropriate site management protocol and controls identified by the appointed contractor's
7	DEV			Future maintenance workers	Very Low	

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						method statement and risk assessment (MSRA).
8	DEV			Adjacent site users (e.g. commercial units, Luton Airport, buildings)	Low	The Airport Access Road will replace existing hardstanding at the eastern end, however, the western end the route will pass through currently undeveloped land, if volatile contaminants are present this could impact vapour migration pathways. The GQRA has not identified any significant soil source and therefore this PCL has been excluded from further assessment at this stage. Additional GI at detailed design stage will be required to support this conclusion.
9	DEV		Leaching of contaminants to groundwater	Principal aquifer in the Chalk	Low	The presence of road hardstanding will reduce the infiltration and potential mobilisation of leachable contaminants It

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						is also anticipated that the Airport Access Road will have a drainage and collection system to minimise percolation through contaminated material. In addition the groundwater is anticipated to be at depth beneath this area (approximately 40m bgl) and there are no structures which are likely to require deep foundations which could with the aquifer. No further assessment is therefore required at this stage. The previous GI did not include leachate testing or groundwater sampling and analysis, this should be scoped into any GI completed at detailed design stage to confirm this conclusion.
10	DEV	Ground gases from Made Ground	Migration into buildings and build-up of gases (off-site)	Users of adjacent commercial	Low	Ground gases may be produced where a significant thickness of

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
		e.g. methane, carbon dioxide		properties – public/airport operatives		made ground is present. Significant depth of Made Ground is present at the western end of the proposed Airport Access Road. Monitoring to date has not recorded methane above 0.0% by volume and low concentrations of CO_2. No further assessment is required at this stage but additional GI to fill in data gaps and confirm mitigation and design requirements prior to construction.
11	DEV	Contaminants in soils	Direct contact with contaminated materials	Building infrastructure (foundations / piled foundations), Services (water supply pipes)	Moderate	Aggressive ground conditions have not been assessed as part of previous reporting. Chemical attack on foundations may lead to expedited deterioration and cause stability issues to the final construct. Contaminants may permeate through Water supply pipes laid within

PCL No.	Phase applicable to (see key)	Source	Pathway	Receptor	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
						contaminated soils. A BRE SD1 assessment of aggressive ground conditions should be undertaken to provide suitable classification of concrete. Should water supply pipes be included in the final scheme then a UKWIR assessment should be undertaken to inform pipe selection. Both assessments to be completed at detailed design stage.
12	CON	Unexploded Ordnance	Encountering UXO during excavation,	Construction workers/public/ commercial units	Low/Moderate	Correct detection and monitoring procedures will be required during site works to mitigate risks
KEY: CON- PCL during excavation, remediation and construction phase DEV- PCL associated with future use of proposed development						

14 CONCLUSIONS OF GENERIC QUANTITATIVE RISK ASSESSMENT

14.1.1 This GQRA report focussed on the main area of concern with respect to potential contamination identified in the PRA, which is a former landfill site (Area A). In addition, the Airport Access Road to the west of the airport was also assessed as the PRA identified that GI work had been undertaken previously but no assessment of the results had been undertaken to determine the risk from the contamination.

14.1.2 The following sections report the findings of the GQRA for these two areas and summarise where further work is required.

14.2 Airport Access Road

14.2.1 Two phases of ground investigation have been undertaken for the New Road in 2017(Ref. 8) and 2018 (Ref. 9) which were reviewed in the PRA (Ref. 1). The sampling locations are distributed across the route at approximately 50m spacing. Chemical testing was not undertaken at each location, so in some areas the chemical sampling density does not meet that of an exploratory investigation as set out in BS10175. Samples were tested for a range of analytes relevant to the past contaminative land uses and provides a preliminary dataset to assess the risks posed to human health.

14.2.2 The conclusions of the GQRA for the new road are discussed in the sections below.

Human health

Soils

14.2.3 There were no exceedances of the chronic or acute assessment criteria for human health when compared to the soils data.

14.2.4 However as noted above in **Section 14.2.1** the current chemical sampling density does not meet that of best practice guidance set out in BS10175 and there may areas of potential contamination which have not yet been sampled. Notwithstanding this, the overall risk to future users of the road is considered to be very low as the road will be predominately hard standing minimising potential exposure to underlying soils. Therefore no further detailed risk assessment is required at this stage. Further ground investigation may be required at detailed design stage to inform the risks to construction workers and future maintenance workers.

Groundwater and soil vapours

14.2.5 The proposed Airport Access Road does not include any buildings, as such there is no potential for accumulation of vapours in indoor air. However, further GI and/or assessment may be required at the detailed design stage to inform the risks to construction workers, future maintenance workers.

Asbestos

14.2.6 Assessment of the asbestos fibres detected in the soils indicated that the majority were below 0.001% v/v, however there are some higher results. The distribution of the detected samples was typically limited between Dairyborn Escarpment/Airport Way and Percival Way/Presidents Way.

14.2.7 The greatest potential risks from asbestos will be during enabling and construction works, when soils are disturbed and may allow fibres to be released into ambient air. No further detailed assessment is required at this stage but further consideration of the potential risks from asbestos fibres should be undertaken at the detailed design stage to inform the risks to construction workers. The likely classification of works under the Control of Asbestos Regulations (Ref. 40) and risks to construction workers will need to be assessed using CL:AIRE's Joint Industry Working Group (JIWG) Decision Tools (Ref. 36) prior to any works.

Controlled waters

14.2.8 No groundwater sampling or soil leachate testing was undertaken as part of the GI on the proposed New Road. It is not envisaged that the proposed earthworks will interact with the groundwater, which is recorded at approximately 40m bgl. However, this will need to be reviewed at the detailed design stage. Therefore no further assessment is required for controlled water risks at this stage.

14.2.9 The drainage strategy for the road will be undertaken at the detailed design stage but it should ensure that no infiltration will occur across the landfill area or in other areas of Made Ground along the alignment.

Ground gas

14.2.10 The proposed Airport Access Road does not include any buildings, as such there is no potential for accumulation of gases in indoor air. However, further GI and/or assessment may be required at the detailed design stage to inform the risks to construction workers, future maintenance workers and adjacent site users.

14.2.11 Ground gas monitoring collected during the GI works has been used as part of an overall assessment of the area outside of Eaton Green Landfill

14.3 Area A- landfill

14.3.1 A preliminary and detailed GI have been undertaken within the landfill area. The sampling locations have a good spatial, lateral and vertical distribution, encompassing all the main eras of waste deposition. A significant number of soil (1219 samples), groundwater and leachate (328 tests) and gas/VOC samples (96 tests) have been undertaken and analysed to industry standards providing a comprehensive data set for the area. The investigations undertaken to date provide a good understanding of the general composition of the waste, groundwater, leachate and landfill

gas conditions within this area. The data was considered adequate to inform the risk assessment.

14.3.2 The waste characteristics described in **Section 8** indicated that overall there is no distinct spatial variation in the waste types or chemistry. As such it was not considered necessary to sub-divide the landfill for the risk assessment.

14.3.3 The risk assessment considered a reasonable worst-case scenario is representative of the conditions at the landfill. This is considered conservative but allows for the heterogenous nature of the landfill in the assessments.

14.3.4 However, due to the nature of historic landfills i.e. no specific controls on waste types deposited, there is likely to be a high degree of heterogeneity in the waste. Whilst a substantial amount of GI data is available; no GI can completely characterise a site and contamination may exist in an area where contamination was not expected. Therefore, the remediation strategy will need to include measures to detect and deal with unexpected contamination.

14.3.5 The conclusions of the human health, controlled waters and gas GQRA for Area A are discussed in the sections below.

14.4 Human health

Soils

Chronic assessment

14.4.2 The GQRA indicated that overall there were very few exceedances in relation to the overall number of tests undertaken. For all contaminants less than 3% of the samples undertaken for analysis had exceedances. Most of the exceedances are within one order of magnitude of the GAC, with a number only marginally exceeding the criteria.

14.4.3 The majority of the exceedances were within the construction waste type (40%).

14.4.4 Exceedances for trimethylbenzene were noted which is a volatile aromatic hydrocarbon. The exceedances were co-located with other volatile compounds which exceeded their respective GACs i.e. naphthalene and 2-methylnaphthalene. The risks from soil vapours requires further consideration (see below).

14.4.5 Overall the concentration of contaminants in the landfill are not significantly elevated. The majority of contaminants which exceeded present a risk through direct contact. The development is largely hardstanding (see Figure 16) and therefore future users are unlikely to come into direct contact with the underlying material. However, given the heterogeneous nature of landfills and the lack of engineered cover system, it should be assumed that measures will be required, particularly in landscape areas to prevent direct contact with the waste.

14.4.6 No further detailed assessment is required to inform the chronic risks from soils.

Acute assessment

14.4.7 Comparison of the soil samples against the AGAC indicated one exceedance for arsenic of the oral criteria for a child trespasser during construction works, which was considered an unlikely scenario. Appropriate measures should be undertaken during construction to ensure the site is secure and dusts are controlled. Based on the results of the acute assessment no special precautions, above and beyond best practice, are considered necessary during construction works to control potential acute risks.

14.4.8 No further detailed quantitative assessment of the acute risks to human health are required.

14.4.9 As detailed above, due to the heterogenous nature of landfills, measures should be taken during construction works to detect and deal with unexpected contamination i.e. a watching brief. If significant unexpected contamination is encountered further risk assessment may be required.

Soil vapours

14.4.10 There are no generic assessment criteria for assessing soil gas vapour concentrations. Therefore, PCLs associated with soil gas vapours require further DQRA.

Groundwater vapours

14.4.11 Volatile contaminants in groundwater have the potential to cause risk to human health via volatilisation and migration of vapours into overlying buildings or outdoor air space followed by inhalation. During the 2018 GI some perched water was encountered, therefore, the potential risks associated with volatile contaminants in perched water were assessed.

14.4.12 Exceedances for TPH >C10-C12 Aliphatic and 1,2,4- Trimethylbenzene were noted at one location (WS224). The solubility limit for TPH >C10-C12 aliphatic was exceeded, suggesting that free product may be present at this location. Site observations and during the monitoring rounds confirmed the presence of free product at this location.

14.4.13 WS224 is located close to the proposed excavation of landfill materials for the airside platform and there is the potential for the product present to be mobilised during the works and a pathway created to the underlying chalk. Therefore, the free product at this location should be removed as part of the works. Any perched water in the material will also be removed. The material from this location is unlikely be suitable for reuse without treatment to remove the product present.

14.4.14 No further detailed assessment is required to inform the risks from groundwater vapours in perched groundwater.

14.4.15 As detailed above, due to the heterogenous nature of landfills, measures should be taken during construction works to detect and deal with unexpected contamination i.e. a watching brief. If significant unexpected contamination is encountered further risk assessment may be required.

Asbestos

14.4.16 Assessment of the asbestos fibres detected in the soils indicated that the majority were below 0.001% v/v, however there are some higher results. In general, higher concentrations of asbestos in soil have the capacity to liberate higher concentrations of asbestos fibres into the air but this is also very dependent on the type of ACM present and its ability to release fibres.

14.4.17 The nature of the asbestos encountered in the area of the former scrapyard appeared to be different from that encountered within the landfill, no visible bundles of fibres were noted in the landfill during the GI.

14.4.18 Due to the nature of the works to be undertaken at the site i.e. extensive excavation and the detection of some higher concentrations of asbestos fibres in the GIs, further detailed assessment is required. The detailed assessment is presented in the DQRA for Human Health and Ground Gas (Ref. 55), provided as **Appendix 17-3** to the PEIR.

14.5 Ground gas

14.5.1 The gas spot monitoring results were considered to be CS2 with a few CS3 readings. The CS3 readings recorded were as a result of negative flow rates, which were considered to be a positive flow rate for the purposes of the initial assessment. Negative flow rates indicate that the gas pressures within the ground are below that of atmospheric pressure and can occur due rapid changes in atmospheric pressure. The effect of atmospheric pressure on the gas regime is more accurately measured with continuous gas monitoring. The detailed assessment of the effect of atmospheric pressure and the gas regime of the site is presented in the DQRA: Human Health and Ground Gas (Ref. 55).

14.5.2 Outside of the landfill, the levels of gas recorded are low, with the general exception of BWS203, BWS211, BWS214, BBH209, BBH210 and LF-BH05G, which are all located adjacent to the landfill boundary. LF-BH05G and BBH210 are located within an area which has a significant thickness of Made Ground. Flow rates across the holes were low. The analysis indicates that the area outside the landfill is CS2, which is considered low risk, although care should be taken during the design and construction phases of the development to ensure that no preferential pathways are created.

14.5.3 Further detailed gas risk assessment is required of the ground gas including consideration of the continuous gas monitoring to inform the likely protection measures. The detailed assessment is presented in the DQRA (55).

14.6 Controlled waters

14.6.1 The GQRA undertaken indicated that overall there were relatively few exceedances of potential contaminants of concern recorded in groundwater beneath the site. Those which did exceed tended to be in boreholes beneath or close to the landfill and were typically in localised areas. There is limited evidence of any significant contaminant plume migrating down-hydraulic gradient of the landfill.

14.6.2 The assessment of the material in the landfill, its leachability and the landfill leachate indicated there were more exceedances than within the groundwater. The contaminants of concern identified from the GQRA which required further detailed assessment are summarised in **Table 14.1.** Results are provided in the DQRA: Controlled Waters (Ref. 56), provided as **Appendix 17-4** to the PEIR.

14.6.3 Whilst PFAS has been observed to exceed DWI guidance values it is pertinent to note that the use of the DWI values is conservative when applied to an aquifer body. Therefore, at this stage, PFAS have not been taken forward to DQRA. The Environment Agency are currently developing their understanding and approach to assessing and managing the risks from PFAS. Further assessment may be required at detailed design stage.

Table 14.1 Key contaminants of concern in the groundwater and landfill requiring further detailed controlled waters assessment

Groundwater	Landfill (Soils, Soil leachate and leachate)

Supplementary gas and groundwater sampling and monitoring programme

1 Introduction

London Luton Airport Limited (LLAL) intends to submit an application for a development consent order (DCO) for expansion of London Luton Airport.

The masterplan for this expansion is currently being developed and it is envisaged that it will involve development of a former landfill adjacent to the airport. The former landfill occupies an area of 53 hectares[1] and was previously known as Eaton Green Landfill.

The extent of development is not yet determined, however sufficient ground investigation is required to characterise the potential risks associated with development of the former landfill and any mitigation measures which are likely to be required.

This report sets out the strategy for further ground investigation of the landfill. It is a working document and will be updated as the masterplan for the site is developed.

1.1 Previous Ground Investigations

A Preliminary Risk Assessment (PRA)[2] has been undertaken for the site, which reviewed in detail the site and environment setting, site history, previous site investigation records, geology, hydrology and hydrogeology. The PRA identified that records available from previous site investigations undertaken at the landfill were limited to the western edge of the landfill. These investigations were:

- Soil Engineering (2012) Factual report on a ground investigation for Luton Airport FBO
- Delta Simons (2012) Preliminary Site Investigation. Proposed Taxiway Foxtrot, London Luton Airport. Project Number 12-0319.01

An exploratory ground investigation (GI) was undertaken by Structural Soils between 8 December 2016 and 31 January 2017 comprising:

- 18 No. resonance (sonic) boreholes drilled to a depth of between 6.00 mbgl and 60.00 mbgl;
- 2 No. Cable Percussion Boreholes extended with rotary drilling. Boreholes to a depth of between 6.45 mbgl – 9.00 mbgl with rotary follow on to a depth of 58.50 mbgl;
- 9 No. permeability tests in boreholes;
- 26 No. Dynamic Probe Penetrometer tests;
- Geotechnical and environmental soil sampling and laboratory testing; and

[1] Environment Agency boundary for landfill makes area 53 ha but ground investigation information shows area filled is actually 45ha
[2] Arup (June 2017) London Luton Airport Limited. Century Park Development, Airport Way. Contamination Preliminary Risk Assessment-Former Eaton Green Landfill

- 17 No. groundwater and gas monitoring standpipes.

In addition to this GI of the landfill, two further investigations were undertaken in the area in 2016-2107; an investigation undertaken for the Access Road for the proposed Century Park Development and one for the wider Century Park Development. A plan of the GI locations associated with these investigations is shown in Figure 1.

1.2 Summary of Previous Work with respect to Contamination

Following the GI undertaken on the landfill, an interpretative report was undertaken by Arup which included a generic quantitative risk assessment (GQRA) and detailed quantitative risk assessment (DQRA)[3].

The Conceptual Site Model (CSM) developed as part of the interpretative report is included in Appendix A. The DQRA was developed for the Century Park development but it is considered that the CSM for the airport expansion is likely to have similar risks and therefore is a sound basis for development of the ground investigation strategy.A summary of the findings of the DQRA report is provided below.

1.2.1 Human health

The ground investigation results to date suggest that the chemistry of the landfill presents little risk to future site users. However, an appropriate cover layer will be required to protect the development from odours and the poor physical properties of the waste.

1.2.2 Controlled waters

Overall the groundwater monitoring undertaken to date provides little evidence that the landfill is causing significant contamination of the groundwater. This suggests that providing appropriate techniques are used during construction to prevent downward migration of contaminants, it is unlikely that development will result in significant contamination of the groundwater.

1.2.3 Ground Gas

Elevated concentrations of methane and carbon dioxide were detected during monitoring. The concentrations were noted to be more elevated in the areas where thicker deposits of more recent waste disposal (1970s/1980s) has taken place. The preliminary assessment indicated the gassing regime is a Characteristic Situation 4.

1.2.4 DQRA Conclusions

Further site investigation and groundwater quality monitoring is required to confirm these findings and to inform the design of the enabling works for the development.

[3] Arup (September 2017) London Luton Airport Limited. Century Park Development, Airport Way- Landfill Area. Contamination Quantitative Risk Assessment.

2 Ground Investigation Strategy

2.1 Objectives for the investigation

The report on the initial DQRA identified the following objectives for further investigation:

1. *Provide means for up gradient monitoring of groundwater quality;*
2. *Provide more information on the chemistry of the 'industrial' waste contained in the older landfill material;*
3. *Provide further information on the weathering and solution of the top of the chalk;*
4. *Provide more information regarding the nature of each type/era of waste to determine:*
    a. *its potential to be a source of pollution;*
    b. *its potential for future gassing;*
    c. *its likely settlement under the new development;*
    d. *its capacity to be an obstruction to piling;*
    e. *check for radionuclides; and*
    f. *establish the quantity of inert daily cover or construction waste materials.*
5. *Complete the network of gas monitoring installations;*
6. *Inform the design of foundations;*
7. *Provide further installations to monitor leachate;*
8. *Inform the design of earthworks involving waste; and*
9. *Survey the drain that passes through the landfill.*

2.2 Basis for strategy

The strategy for the design of the GI to achieve these objectives has been developed based on a systematic review of the following:

- GI work required to adequately characterise the potential pollutant linkages (PPLs) identified in the CSM in the DQRA to determine their significance;
- GI work required to inform the wider understanding of the site and geotechnical conditions, which is needed to:
    - develop the ground model;
    - characterise the waste; and

- inform the design of earthworks and foundations.

2.3 Guidance on the investigation of contaminated land

In designing this ground investigation strategy, reference has been made to the guidance documents below:

- British Standards Institution (2011) Investigation of potentially contaminated sites- Code of practice BS10175:2011 +A1:2013
- British Standards Institution (2013) Guidance on investigations for ground gas- Permanent gases and volatile organic compounds (VOCs). BS 8576
- British Standards Institution (2017) Soil quality- Part 100: Guidance on the selection of sampling standards. BS ISO 18400-101
- British Standards Institution (2017) Soil quality- Part 101: Framework for the preparation and application of a sampling plan. BS ISO 18400-101
- British Standards Institution (2017) Soil quality- Part 102: Selection and application of sampling techniques. BS ISO 18400-102
- Chartered Institute of Environmental Health (2008) The Local Authority Guide to Ground Gas
- CL:AIRE (2009) Parameterisation of Aquifer Hydraulic Properties: A Contaminants Hydrogeology Perspective. Technical Bulletin TB4.
- CIRIA Report 131 (1993). The measurement of methane and other gases from the ground
- CIRIA Report 151 (1995) Interpreting measurements of the gas in the ground
- CIRIA Report 665 (2007) Assessing risks posed by hazardous ground gases to buildings.
- CIRIA Report 682 (2009) The VOCs Handbook. Investigation, assessing and managing risks from inhalation of VOCs at land affected by contamination.
- Department of the Environment, Transport and Regions (1994) CLR Report no. 4- Sampling Strategies for Contaminated Land.
- Department for Environment Food and Rural Affairs (2006) Industry Profile. Industrial activities which have used materials contamination radioactivity.
- Environment Agency (2000) Secondary model procedure for the Development of Appropriate Soil Sampling Strategies for Land Contamination. R&D Technical Report P5-066/TR
- Environment Agency (2001) Land Contamination: Technical Guidance on Special Sites: MoD Land. R&D Technical Report P5-042/TR/01
- Environment Agency (2001) Land Contamination: Technical Guidance on Special Sites: Nuclear Sites. R&D Technical Report P5-042/TR/06

- Environment Agency (2003) Guidance on Monitoring of Landfill, Leachate, Groundwater and Surface Water
- Environment Agency (2004) Model Procedures for the Management of Land Contamination
- Environment Agency (2004) Guidance for monitoring trace components in landfill gas
- Environment Agency (2006) Guidance on the design and installation of groundwater quality monitoring points
- Institute of Waste management (1998) Monitoring of landfill gas
- NHBC (2007) Guidance on evaluation of development proposals on sites where methane and carbon dioxide are present
- Safegrounds (2012) Nuclear Industry Group for Land Quality. Industry Guidance. Qualitative Risk Assessment for Land Contamination, including radioactive contamination.

2.4 Ground Investigation Rationale

2.4.1 Characterise PPLs

The GI required to assess the significance of each of the potential pollutant linkages (PPL) identified in the Arup DQRA report is set out in Table 1. The specific element of the PPL linkage being targeted by the GI is also indicated as follows:

S – source characterisation

P – pathway assessment

R – receptor monitoring

This sets out where work needed and identifies the frequency of sampling or testing where this is prescribed by guidance. The techniques proposed are described in section 3 and sampling and analytical strategies for those elements not prescribed by guidance are provided in sections 4 and 5.

Table 1 Summary table of potential pollutant linkages and proposed ground investigation

Receptor	PPL no.*	PPL	PPL element target and proposed GI	Proposed GI	Justification
Future users e.g. workers/members of the public	**1**	Ground gases from former landfill e.g. methane-migration into future buildings and build-up of gases	**S -**confirmation and determination of gas generation potential of the waste **P**-ground gas monitoring across site	32 boreholes 23 Window samples	Supplement current monitoring network and confirm current gassing regime. The requirements for number of monitoring points, frequency and duration of ground gas monitoring is detailed in a number of best practice guidance documents including CIRIA 665 and Local Authority Ground Gas Guidance. For older domestic landfills (moderate hazard potential) and low sensitivity of end use it details a spacing of 25-75m spacing. The higher end of the spacing has been adopted as continuous monitoring techniques, in conjunction with conventional spot sampling to give additional confidence in the ground gas regime. 75m spacing across 450,000 m^2 site is equal to 80 locations, 24 locations have been undertaken previously.). Therefore 56 locations are required across the site. This is proposed to be a mixture of deeper (boreholes) and shallow locations (window samples). Due to site access constraints, achieving the required number of locations is unlikely to be possible and a total of 55 locations are proposed.
	5 &22	Soils/waste- Direct contact e.g. dermal contact, soil ingestion.	**S-** confirmation and determination of nature and extent of contamination in soils and waste	76 trial pits Testing of samples from boreholes and window samples undertaken for PPL 1	Supplement the existing information and confirm conditions. Trial pits to inform shallow conditions (between 3-6 m bgl) as this is the material most likely to require management during the earthworks and may be reused within the development.
		Direct or indirect contact with radionuclides- incurring radiation dose by indirect dose received from ingestion of radium (or other alpha emitting contaminated material) or direct risk from contact with beta emitters such as Carbon-14 or Caesium-137	**S-** confirmation and determine the nature of and extent of any radiological contaminants in the waste	10 boreholes in older waste (*included in the 32 total detailed in PPL no.1*)	Radioactive materials (if present) will be limited to the earlier waste in the landfill which was deposited prior to the introduction of the Radioactive Substances Act in 1963. Boreholes into older waste will include measures to check for presence of radioactive substances in the waste. Unlikely to be direct contact with older wastes in proposed development but arisings from piling and foundations activities may be reused, therefore testing will determine if suitable for reuse in development.
	25	Inhalation of soil derived dusts	**S-** confirmation and determination of nature and extent of contamination in soils and waste	Testing of samples from trial pits undertaken for PPL 5 & 22	Supplement the existing information and confirm conditions. Trial pits to inform shallow conditions (between 3-6 m bgl) as this is the material most likely to require management during the earthworks and may be reused within the development.
	8 &29	Inhalation of vapours from VOCs in the waste/soils	**S-** confirmation and determination of nature and extent of volatile contaminants in soils and waste **P**-soil vapour monitoring across site	Testing of samples from boreholes and trial pits undertaken for PPL 5 & 22	Previous exploratory GI did not indicate any specific sources of volatile organic contaminants (VOCs), therefore testing to be undertaken in non-targeted manner from boreholes being undertaken for other PPLs in order to confirm concentrations of VOCs at the site. Supplement existing information with further soil vapour monitoring. Monitoring to be undertaken from selected ground gas boreholes undertaken as part of PPL no. 1.
	8	Volatile radionuclides occupying buildings overlying radioactive land contamination	**S-** confirmation and determine the nature of and extent of any radiological contaminants in the waste **P**-volatile radionuclide monitoring (if required)	Testing of samples from boreholes made into the older waste undertaken for PPL 5 & 22	Boreholes into the deeper older waste to determine the potential radiological risks. If radionuclides detected which are considered to potential risks through volatilisation then monitoring will be undertaken for volatile radionuclide compounds.
	15	Landfill leachate- direct contact e.g. dermal contact, soil ingestion	n/a	n/a	No specific investigation required for this PPL as determined in DQRA that no potential for future users of the site to come into direct contact with landfill leachate. However the extent and nature of landfill leachate will be determined as part of the assessment of other PPLs.

Receptor	PPL no.*	PPL	PPL element target and proposed GI	Proposed GI	Justification
Adjacent site users (e.g. residential housing and other buildings on Luton Airport)	**2**	Ground gases from former landfill e.g. methane-migration off-site through preferential pathways and build-up of gases	**P-** determine potential for ground gas to migrate off-site through preferential pathways	8 boundary gas monitoring locations (comprising 4 boreholes and 4 window sample locations)	Houses lie within 50m of the northern boundary of the landfill in the head of a dry valley – it is likely that there is no impermeable clay with flints layer present which would inhibit gas migration. The nature of the chalk means there may be fracture flow. Table 5.2 in Local Authority ground gas guidance details recommended range of typical borehole spacing for boundary monitoring to assess off-site conditions. For fissure or fracture flow dominated permeable strata (for example blocky sandstone or igneous rock) and development within 150 m, the borehole monitoring spacing should be 5-20 m. A mid-range of 12.5 m has been selected to assess potential risks on the section of the northern boundary closest to the houses and where it is a less sensitive land use (commercial properties) a lower frequency of 50m spacing has been used. The northern boundary is approximately 200 m in length and therefore 11 locations are required. Due to access restrictions along the northern boundary (roadway, limited space on pavements and sloping ground), achieving the required number of boreholes along this boundary is unlikely to be possible. 8 locations have been placed along available parts of the boundary.
	2			19 boundary gas monitoring locations (comprising 6 boreholes and 13 window samples locations)	Other areas surrounding the landfill considered to be lower risk. Adjacent to the west and south is London Luton Airport. To the north east are houses at a distance of between 90 and 400 m. To the east is agricultural land, with no development. Clay with flints is present on the sides of the valley which is likely to act to impede flow of gas. Table 5.2 in the Local Authority ground gas guidance details recommends a range typical borehole spacing for boundary monitoring to assess off-site for Uniform low permeability strata (for example clay); development within 150 m of 10-50 m, development within 250 m of 20-50 m and where there is no development 50-150 m. The actual boundary of landfilling has been assumed for these distances, rather than the EA boundary which includes an area in the northeast which has not been landfilled. Therefore the following is required: • where the houses are closest on the north eastern boundary, a 30 m spacing (mid-point of 10-50 m) has been assumed for half of the eastern boundary (300 m length at 30 m spacing = 10 locations) • the remaining part of the eastern boundary a wider spacing of 100 m (mid-point of 50-150m) of has been assumed due to no development within 250 m (300 m length spacing at 100 m spacing = 3 locations). • there is no development to the south of the landfill site, it is either agricultural land or airport land without any structures e.g. runway, therefore a wider spacing of 100 m (mid-point of 50-150 m) of has been assumed (660 m length at 100 m spacing = 7 locations). There are currently already 2 ground gas monitoring locations on this boundary, therefore a further 5 locations are required. Due to ecological constraints (Badger Setts), achieving the required number of boreholes along this boundary is unlikely to be possible and 4 locations have been placed along available parts of the boundary. • the airport is adjacent to the west of the landfill, the nearest airport building is 250m from the western edge of the landfill, with the exception of two hangars which have been built over the landfill and some additional hangar buildings approximately 150m northwest of the landfill boundary. Due to the low sensitivity of these developments a wider spacing of 100m (mid-point of 50-150m) has been assumed (1000m length at 100m spacing = 10 locations). There are currently 3 ground gas locations on this boundary, therefore a further 7 locations are required. Due to restrictions on accessing airside, achieving the required number of boreholes along this boundary is unlikely to be possible. 2 locations have been placed along available parts of the boundary.
	10 &26	Soils/waste- inhalation of airborne contaminants and microorganisms	**S-** confirmation and determination of nature and extent of contamination in soils and waste	Testing of samples from trial pits undertaken for PPL 5 & 22	Supplement the existing information and confirm conditions. Trial pits to inform shallow conditions (within 6m bgl) as this is the material most likely to require management during the earthworks and may be reused within the development.
	10 &26	VOCs within the landfill- migration of volatile contaminants through preferential pathways and inhalation of vapours	**P-** determine potential for VOCs to migrate off-site through preferential pathways	Included in the work proposed for PPL 2	Supplement existing information and confirm condition – VOC monitoring from selected ground gas boreholes along boundary to check for VOC migration from landfill.
Construction workers and future maintenance groundworkers	**3,4,20 &21**	Soils/waste- Direct contact e.g. dermal contact, soil ingestion.	**S-** confirmation and determination of nature and extent of contamination in soils and waste	Testing of samples from trial pits undertaken for PPL 5 & 22	Trial pits to assess PPL no.5 will be used to characterise the waste in the top few metres, which is most likely to be the waste requiring management during the earthworks and that future construction workers and maintenance groundworkers are likely to come into contact with.
	3,4,20 &21	Direct or indirect contact with radiological waste- incurring radiation dose by indirect dose received from ingestion of radium (or other alpha	**S-** confirmation and determine the nature of and extent of any	Testing of samples from boreholes made into the older waste	Radioactive materials (if present) will be limited to the earlier waste in the landfill which was deposited prior to the introduction of the Radioactive Substances Act in 1963. Boreholes into older waste to check for presence of radioactive substances in the waste.

Receptor	PPL no.*	PPL	PPL element target and proposed GI	Proposed GI	Justification
		emitting contaminated material) or direct risk from contact with beta emitters such as Carbon-14 or Caesium-137 during piling works.	radiological contaminants in the waste	undertaken for PPL 5 & 22	
	6,7,27& 28	Inhalation of vapours from VOCs in the waste/soils	**S**- confirmation and determination of nature and extent of volatile contaminants in soils and waste **P**-soil vapour monitoring across site	Testing of samples from boreholes and trial pits undertaken for PPL 5 & 22	Previous exploratory GI did not indicate any specific sources of volatile organic contaminants (VOCs), therefore testing to be undertaken in non-targeted manner from boreholes being undertaken for other PPLs in order to confirm concentrations of VOCs at the site. Supplement existing information with further soil vapour monitoring. Monitoring to be undertaken from selected ground gas boreholes undertaken as part of PPL no. 1.
	13&14	Landfill leachate- direct contact e.g. dermal contact, soil ingestion	**S**- confirmation of presence, extent and quality of leachate within the landfill	5 landfill leachate collection wells, See PPLs no. 9 &19	Supplement the existing information and confirm current conditions. Leachate conditions at the landfill will be determined as part of PPLs no. 9 & 19 below.
	11,23&24	Inhalation of soil derived dusts	**S**- confirmation and determination of nature and extent of contamination in soils and waste	Testing of samples from boreholes and trial pits undertaken for PPL 5 & 22	Supplement the existing information and confirm conditions. Trial pits undertaken to inform shallow conditions (within 6m bgl) this is the material most likely to require management during the earthworks and that future construction workers and maintenance groundworkers are likely to come into contact with.
Controlled waters- Principal aquifer in Chalk	**9&19**	Driving of contaminants downward during any future piling	**S**- confirmation of presence, extent and quality of leachate within the landfill.	5 landfill leachate collection wells	Supplement the existing information and confirm current conditions. Non-targeted general spread across site to try and determine presence of leachate across landfill. Environment Agency guidance LFTGN02 is mainly aimed at sites with current waste management licence or environmental permit, however some of the principles are applicable to historic sites and it provides a useful framework. The guidance details an appropriate number of leachate monitoring points as one quality point per 5 ha. Landfill area is 44.7ha (excluding area not filled on EA boundary), this would equal 9 monitoring locations to meet guidance. 4 wells present from previous ground investigation, therefore 5 additional wells required. Boreholes to be installed which are slotted to base of waste and then 1 m plain section sump in chalk for collection of leachate.
	16	Downward migration of contaminants in the landfill into aquifer	**P-**determine hydrogeological conditions at the site and changes with depth in the chalk. **R**- undertake regular monitoring of the groundwater beneath the landfill and off-site.	5 deep groundwater boreholes	Supplement the existing information and confirm current conditions. Hydrogeological conditions to be determined by 5 no. deep boreholes which penetrate at least 20m below lowest groundwater level. These locations will also assess the weathering and solution features in the top of the chalk. Locations will be designed to complement existing groundwater monitoring locations and will be used to verify groundwater monitoring results being undertaken as part of the long term monitoring programme. Parallel to this further investigation there is supplementary gas and groundwater monitoring being undertaken on the boreholes from the preliminary investigation, which will provide robust data on the variation in conditions within the landfill.
	30	Contaminants in groundwater associated with Luton Airport Lateral migration in groundwater onto site	**P**- determine groundwater flow direction **R**- undertake regular monitoring of the groundwater beneath the landfill and off-site	2 off-site boreholes	Environment Agency guidance LFTGN02 details that at least one location should be installed upgradient. Allowance has been made for 2 deep boreholes off-site which penetrate at least 20m below lowest groundwater level. 2 locations have been allowed to ensure variability in groundwater is accounted for.
	-	Migration of contaminants via preferential pathways i.e.	**P-**determine whether drain passing through landfill provides a preferential pathways for contaminants	Survey drain passing through landfill	CCTV proposed to survey drain. CCTV survey being undertaken by Pell Frischmann who are designing the access road.
Controlled waters- Potable water groundwater abstraction	**16**	Migration of contaminants in groundwater beneath landfill to groundwater abstraction	**P-**determine hydrogeological conditions at the site and changes with depth in the chalk. **R**- undertake regular monitoring of the groundwater beneath the landfill and off-site.	5 deep groundwater boreholes. See PPL no. 16	Parallel to this further investigation there is supplementary gas and groundwater monitoring being undertaken on the boreholes from the preliminary investigation, which will provide robust data on the variation in conditions in the landfill. This includes monitoring of locations off-site from the landfill to determine whether migration of contaminants is occurring.

Receptor	PPL no.*	PPL	PPL element target and proposed GI	Proposed GI	Justification
Building material and fabric	**12, 17**	Direct or indirect contact with contaminated soils, waste, leachate or vapours which affecting building materials	**S-** confirmation and determination of nature and extent of contamination in soils and waste **S-** confirmation of presence, extent and quality of leachate within the landfill.	Testing of samples from boreholes and trial pits undertaken for PPL 5 & 22 Leachate- See PPLs no.s 9 &19	Supplement the existing information and confirm current conditions. Leachate conditions at the landfill will be determined as part of PPLs no. 9 & 19.
Adjacent agricultural crops and allotments	**18**	Leachate breakout and plant uptake	None required	None required	No specific GI required as will be determined by the GI work undertaken to determine extent of leachate in the landfill and the ongoing leachate and groundwater monitoring

*PPL number relates to numbering to PPLs identified in the Arup DQRA report

2.4.2 Wider understanding of the site and geotechnical conditions

The characterisation of the PPLs is a key driver for the GI but information is also needed to refine the ground model and understand the nature and distribution of the different materials in the landfill. This will inform:

- The design of enabling and remediation works;
- The design of foundations;
- The costing of different options; and
- The estimation of settlement and other physical performance of the waste.

The DQRA identified a number of objectives for investigation to provide this information. The proposed GI with respect to the PPLs, detailed in Table 1, includes locations which will also provide information to help meet these objectives. However some additional works will be required. The additional work required is set out in Table 2 (for completeness the objectives that relate to the PPLs are included but greyed out).

Table 2 How the proposed GI will meet objectives for wider/geotechnical understanding

	Objective identified by DQRA	Further work required
1	Provide means for up gradient monitoring of groundwater quality;	Covered by work to characterise the PPLs
2	Provide more information on the chemistry of the 'industrial' waste contained in the older landfill material;	Covered by work to characterise the PPLs
3	Provide further information on the weathering and solution of the top of the chalk;	9 of the boreholes distributed across the site will be advanced from the base of the waste using CPT through the clay and into the top of the chalk. 5 of the boreholes (not the leachate, CPT or groundwater boreholes) will be advanced to 10m into the chalk.
4	Provide more information regarding the nature of each type/era of waste to determine:	-
	• its potential to be a source of pollution;	Covered by work to characterise the PPLs
	• its potential for future gassing	Covered by work to characterise the PPLs

	Objective identified by DQRA	Further work required
	• its likely settlement under the new development	Detailed inspection of the waste and forensic analysis of its components. Grid of super heavy dynamic probes across site to determine if obstructions present (designed to complement the dynamic probes undertaken during previous GI). Geotechnical testing of 'cover' materials.
	• its capacity to be an obstruction to piling	
	• check for radionuclides	Covered by work to characterise the PPLs
	• establish the quantity of inert daily cover or construction waste materials.	Detailed inspection of the waste and forensic analysis of its components.
5	Complete the network of gas monitoring installations.	Covered by work to characterise the PPLs
6	Inform the design of foundations.	As for objective 3 for the clay and shallow chalk plus the 7 groundwater monitoring holes will be advanced and sampled using techniques that will provide geotechnical information on the natural materials beneath the landfill.
7	Provide further installations to monitor leachate.	Covered by work to characterise the PPLs
8	Inform the design of earthworks involving waste.	Trial pits dug to achieve other objectives will be used to characterise the waste in the top few metres, which is most likely to be the waste requiring management during the earthworks. Boreholes drilled to achieve other objectives will be used to also inform type and era of waste.
9	Survey the drain that passes through the landfill.	Covered by work to characterise the PPLs

3 Site investigation methodology

Two main investigation techniques (trial pits and boreholes) have been proposed for the ground investigation. These have been selected based on the ground conditions previously encountered as well as the potential sources, receptors and associated pollutant pathway identified in Table 1.

The follow investigation methods will be used:

Method	Number proposed	Comment
Trial Pitting	76	16 trial pits will be undertaken to a maximum depth of 6mbgl with the remainder to a maximum depth of 4.5mbgl. Trial pitting is considered the most cost effective and efficient method to examine and sample shallow surface soils/waste conditions, as well as allowing detailed examination of the waste types encountered.
Boreholes-	54	Boreholes in the waste will be drilled using Sonic drilling techniques. Sonic is being used over other more common drilling techniques as it provides very good recovery of material in the waste, with minimal disturbance and little or no drilling fluids. This enables good records of the nature of the waste to be obtained with minimal disturbance from the drilling. For boreholes which are being extended into the Chalk the rig will be switched to Geobore-S to maximise recovery of the chalk and minimise disturbance.
Window Sampling	40	Window sampling will be used to obtain samples at shallow depth and as a cost effective way to install some of the gas monitoring wells.
Cone Penetration Testing	9	The chalk at shallow depth is weathered to a soil and is difficult to sample and can produce misleadingly low strength results in dynamic penetration tests. Cone penetration testing can provide a more accurate measure of the strength of this poorer material.
Dynamic Cone Penetration Testing	76	One of the key risks of developing on a landfill is that obstructions in the waste obstruct the installation of piles. Dynamic cone tests are a cost effective way to detect and map obstructions and will provide information regarding the consistency of the waste across the tip.

Borehole standpipes will be installed depending on their intended objectives as follows:

- ***Leachate*** – 1 m seal at surface and then slotted to base of waste. There will then be a 1 m plain section in the chalk to act as a sump for collection of leachate. Aquifer protection measures will be installed prior to commencing drilling into the Chalk.
- ***Gas*** – the gas boreholes will be installed within the waste on site. The depths and locations of each response zone will be determined based on the conditions encountered. Locations on the boundary will be installed at varying depths to assess potential migration routes i.e. travel in fractures in chalk and migration along service routes.
- ***Groundwater*** – the groundwater boreholes will be installed within the chalk in the saturated zone. The depths and locations of each response zone will be determined based on the conditions encountered and the results of further testing undertaken on the existing boreholes. Single packer tests will be undertaken on selected boreholes during drilling works to inform the response zones (see Section 3.3).

Geophysical techniques comprising a downhole shear wave velocity survey is proposed to be used in some boreholes to obtain information of rock properties of the chalk.

4 Sampling strategy

4.1 Soil/waste

The assessment of the PPL's associated with direct contact or inhalation, and the design of the remediation and enabling works, will rely upon the GI providing sufficient data to characterise the physical and chemical properties of the waste.

The heterogeneity and large volume of the waste means that it will be prohibitively expensive to 'map' the materials and contamination it contains by random sampling. However the following information is known to provide a basis for an investigation strategy:

- Detailed work has been undertaken during the Preliminary Risk Assessment (PRA) and following the preliminary investigation to understand and map the phases of filling of the landfill and the likely nature of waste they contain;
- The contents of the landfill are chaotic but the majority of the material originated from a relatively limited number of sources and the waste from each source can be recognised in samples; and
- The properties of the material from each era and source are likely to lie within a range that is characteristic and can be established by testing.

Based on this the following approach is proposed:

- Detailed visual inspection of each part of the waste recovered during GI;
- Good soil logging with clear descriptions in accordance with BS 5930, including observations of visual and olfactory contamination, together with an estimate of degradable organic content (DOC) will be key to understanding the risk posed by the waste and proportion of biodegradable material;
- Use the information gathered to map the location of the material from different eras and sources; and
- Review of the data gathered as the investigation progresses and compare it to expectations. Use this to detect any material that suggests a significant source that has not previously been identified and schedule further investigation if needed; and

The boreholes, window samples and trial pits proposed in section 2 will provide the following sampling frequencies in the top part of the landfill and in the different eras of waste suggested by the work to date:

Material sampled	Metres of ground to be examined (m)	Volumetric frequency (m^3 of waste/m examined)
Top 5m of landfill	820	2745
1972 - 1982	495	3025

Material sampled	Metres of ground to be examined (m)	Volumetric frequency (m^3 of waste/m examined)
1961 - 1972	150	5310
1955 – 1961	220	7095
1947 – 1955	65	5840
Pre 1947 waste	25	5700

The majority of the landfill was probably deposited in layers of between 0.5 and 1.0m so each metre of waste examined in a hole represents at least one discrete 'sample' of the population of material from that source or era. Overall we consider the above frequency of sampling and inspection to be sufficient to inform a robust characterisation. Where logging of material recovered suggests that material from different sources or a different era is present further investigation and sampling will be carried out to characterise it and establish its extent.

Sufficient physical and chemical testing will be done to adequately characterise the chemical composition and physical properties of the waste from each source and era. The actual rate of testing will be informed by the nature and variation of the material as established by the visual inspection but we estimate that between 30 and 100 samples will need to be tested from each era and source. Samples from the material at shallow depth that are likely to be encountered by the proposed works will be prioritised.

Samples from the landfill will be screened for radionuclides.

4.2 Groundwater

Single packer pumping tests will be carried out within the chalk in selected boreholes. The packer testing will be undertaken as the borehole progresses at 10m intervals and will provide information on changes in hydraulic conductivity with depth. The results will inform the installation details.

3 borehole locations will be installed with groundwater data loggers to measure the variability in groundwater levels, at least one will be upgradient of the landfill site

Sampling of the groundwater in the boreholes will be undertaken, consistent with the methodology established for the supplementary gas and groundwater sampling and monitoring which is currently being undertaken. This is included in Appendix B.

4.3 Gas and vapour

Sampling of the gas and vapours in the boreholes will be undertaken consistent with the methodology established for the supplementary gas and groundwater sampling and monitoring programme which is currently being undertaken. Details are included in Appendix B.

4.4 Landfill leachate

Sampling of the landfill leachate collected in the sumps in the boreholes will be undertaken consistent with the methodology established for the supplementary gas and groundwater sampling and monitoring being undertaken. This is included in Appendix B.

5 Analytical strategy

The analysis required has been determined from the work undertaken to date. The PRA and DQRA identified there is a broad range of potential contaminants which may be present within the landfill. The sections below detail the strategy for analysis for each media.

5.1 Soil/waste analysis

It is envisaged that the majority of soil/waste samples will be analysed for a broad suite of contaminants, consistent with the previous phase of GI. The following additional analysis will be undertaken:

- Bulk samples of the waste for compositional sorting/forensic analysis of waste, to determine the percentage of components of the waste will be done on site;
- Leachability testing to determine the potential for contaminants to be leached from the soil/waste;
- Radionuclide testing, where radiological screening identifies the need;
- Moisture content; and
- Loss on ignition.

5.2 Landfill leachate analysis

Where sufficient sample of landfill leachate is collected within the sumps testing will include (but not be limited to):

- Major elements and ions such as calcium, magnesium, iron, sodium, ammonia, carbonate, sulphate and chloride;
- Trace metals such as manganese, chromium, nickel, lead and cadmium;
- pH,
- Chemical Oxygen Demand (COD), Biological Oxygen Demand (BOD) & Total Organic Carbon (TOC) ;
- Ammoniacal nitrogen;
- Fatty acids (as C); and
- Radionuclide testing if identified in the groundwater and soil/waste.

5.3 Groundwater analysis

Analysis of groundwater samples will be undertaken consistent with the supplementary gas and groundwater sampling and monitoring programme detailed in Appendix B.

5.4 Gas and vapour analysis

Analysis of gas and vapour samples will be undertaken consistent with the supplementary gas and groundwater sampling and monitoring programme, included in Appendix B.

Continuous gas monitors will be installed in some of the boreholes to provide information on the frequency of gas concentration and flow measurements over time. Ground gas purge and recovery testing will be undertaken on all boreholes where continuous gas monitors are installed to measure the rate of ground gas recovery. This is intended to be used in conjunction with conventional spot monitoring to provide robust information with regards to gassing regime at the site.

6 Constraints and Limitations

The following constraints are currently present on site that may affect the ground investigation strategy:

6.1 Badgers and other ecological constraints

Ecological surveys have indicated badgers are present within two areas of the former landfill and there is an exclusion zone around these locations where it is not possible to undertake GI or operate heavy machinery. This area is indicated on Figure 1.

The southern section of Wigmore Park is designated as a County Wildlife Site (CWS), recognised for its neutral and calcareous grassland and adjacent hedgerows. The extent of the CWS is indicated on Figure 1. CWSs do not have legal protection, however the method of working in this area should be agreed with an ecologist to avoid any unnecessary damage to the habitat.

An ecologist will be on site to agree the position of each investigation location and provide advice of any additional constraints during the GI.

6.2 Access restrictions

Some areas of the former landfill are within the airport airside boundary and as such access is restricted. Therefore GI locations have been positioned where possible to avoid restricted access areas.

6.3 Invasive species

The ecological survey identified a large area of Japanese knotweed present to the north of the balancing pond. It is thought that the knotweed stand occupies an area of at least 100 m^2.

6.4 Unexploded Ordnance (UXO)

London Luton Airport was heavily involved with WWII and therefore there is a risk of UXO being present within the wider area, including the landfill. Therefore special provisions in the GI will be required to mitigate the potential risks of encountering a UXO.

6.5 Vegetation

In the south of the site there are several areas which are heavily vegetated and not easily accessible. Therefore, access to these areas may not be possible for GI.

6.6 Topography

The southern boundary of the landfill has a steep bank, therefore it may not be possible to access all GI locations in the south of the site.

6.7 Design limitations

The GI has been designed to investigate the entire site and is not linked to a fixed design for the development. Therefore, it is not possible to target areas which may have a higher impact on the environment i.e. where cutting into the waste will take place. The GI has been designed to provide sufficient information to inform the PPLs identified in the CSM. However, further GI or trials may be required to inform the detailed design.

Appendix A

Conceptual Site Model from DQRA

PPL No.	Sources	Pathways	Receptors	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
On-site					
1	**Ground gases from former landfill e.g. methane**	Migration into future buildings and build-up of gases	Future users e.g. workers/members of the public	Very High	GI data indicates elevated landfill gases, particularly in the areas of thicker more recent waste disposal in the north of the landfill. Further monitoring is required to characterise the risks from landfill gases fully. Risk to future development can be mitigated by appropriate design of ground gas mitigation measures.
2		Migration off-site through preferential pathways	Adjacent site users (e.g. residential housing and other buildings on Luton Airport)	Moderate	Development of the site may alter the ground gas regime and lead to migration of ground gases off-site. Further monitoring is required to characterise the risks from landfill gases fully.
3	**Waste in former landfill**	Direct contact e.g. dermal contact, soil ingestion	Construction worker	Low	Construction workers may be exposed to areas of landfill waste during future excavation. Any future excavation work would adopt appropriate site management protocols and PPE.
4			Future maintenance workers	Low	Maintenance workers may be exposed to areas of landfill waste during future excavation. Any future excavation work would adopt appropriate site management protocols and PPE.
5			Users of future development – general public/workers	Low	The GI indicated the risk to future occupants of the development is likely to be low. The future development will either be hardstanding or include an engineered cover layer, therefore there is unlikely to be any contact with waste material in the landfill.
6		Inhalation of vapours	Construction worker	Low	The risk assessment suggests that there are not significant concentrations of volatile contaminants presented within the landfill. However, this is based on limited monitoring and further GI and monitoring should be undertaken to confirm the results. Risk to construction workers and future maintenance workers is considered to be lower than future users as exposure is likely to be in outdoor air and therefore vapours will be diluted.
7			Future maintenance workers	Low	
8			Users of future development – general public/workers	Low	The assessment of the monitoring results undertaken as part of the GI works indicated that levels of soil vapours did not pose a risk to future users of the proposed development. However, this is based on limited monitoring and further GI and monitoring should be undertaken to confirm the results.

PPL No.	Sources	Pathways	Receptors	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
9	**Waste in former landfill**	Driving of contaminants downward during any future piling	Principal aquifer in Chalk	Moderate	The risk assessment has indicated that based on current data there is unlikely to be a significant risk to the groundwater from the landfill. However, care will be required during construction not to create a pathway. Risk from piling and construction can be mitigated by completion of piling risk assessment report to determine appropriate assessment for pile design and construction.
10		Inhalation of airborne contaminants and microorganisms	Adjacent site users (e.g. residential housing and other buildings on Luton Airport)	High	Future works may involve some limited movement of waste i.e. for disposal or relocation, therefore there is the potential for generation of airborne contaminants. Potential to affect adjacent site users. Good site management practices and mitigation measures would reduce the potential risk. Any future works should have appropriate Management Plans in place.
11			Construction workers	Moderate	Construction workers may be exposed to areas of landfill waste during future excavation. Any future excavation work would adopt appropriate site management protocols and PPE.
12		Direct contact of foundations of future development	Foundations of future buildings	Moderate	Presence of landfill waste in contact with building foundations may cause damage to foundations through aggressive ground conditions. Site investigation data will be considered in the design of the foundation. Risk can be mitigated by appropriate design to select suitable foundation materials.
13	**Leachate in former landfill**	Direct contact e.g. dermal contact, soil ingestion	Construction workers	Low/Moderate	Construction workers may be exposed to areas of landfill leachate during future excavation. The GI indicates there is likely to be limited leachate present, but further investigation and monitoring is required to confirm the findings. Any future excavation work would adopt appropriate site management protocols and PPE.
14			Future maintenance workers	Low/Moderate	Maintenance workers may be exposed to areas of landfill leachate during future excavation. The GI indicates there is likely to be limited leachate present, but further investigation and monitoring is required to confirm the findings. Any future excavation work would adopt appropriate site management protocols and PPE.
15			Users of future development – general public/workers	Low	The future development will either be hardstanding or include an engineered cover layer, therefore there is unlikely to be any contact with any potential leachate in the landfill.
16		Downward migration of leachate	Principal aquifer in Chalk	Low/Moderate	The GI indicates there is likely to be limited leachate present, but further investigation and monitoring is required to confirm the findings. The groundwater monitoring data from beneath the landfill and outside the boundary does not suggest a significant leachate plume affecting the aquifer.

PPL No.	Sources	Pathways	Receptors	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
					However, this is based on limited GI data and further investigation and monitoring is required to confirm the findings.
17		Direct contact with foundations of future development	Foundations of future buildings	Low/Moderate	Presence of leachate in contact with building foundations may cause damage to foundations through aggressive ground conditions. The GI indicates there is likely to be limited leachate present, but further investigation and monitoring is required to confirm the findings.
18		Leachate breakout and plant uptake	Adjacent agricultural crops and allotments	Low	No evidence of leachate breakout currently occurring. However, potential to affect conditions at site during development. The GI indicates there is likely to be limited leachate present, but further investigation and monitoring is required to confirm the findings.
19	**Contaminants in perched water**	Driving of contaminants downward during any future piling	Principal aquifer in Chalk	Low	The GI indicated the waste was relatively dry and no evidence of significant perched water in the landfill was encountered. Further investigation and monitoring is required to confirm the findings. Risk from piling and construction can be mitigated by completion of piling risk assessment report to determine appropriate assessment for pile design and construction.
20	**Contaminants in Made Ground (capping material)**	Direct contact e.g. dermal contact, soil ingestion	Construction workers	Low/Moderate	Construction workers may be exposed to areas with contamination in the Made Ground during future excavation. Any future excavation work would adopt appropriate site management protocols and PPE.
21			Future maintenance workers	Low/Moderate	Maintenance workers may be exposed to areas with contamination in the Made Ground during future excavation. Any future excavation work would adopt appropriate site management protocols and PPE.
22			Users of future development-general public/ workers	Low	The GI indicated the risk to future occupants of the development is likely to be low. The future development will either be hardstanding or include an engineered cover layer, therefore there is unlikely to be any contact with contaminants in the Made Ground
23		Inhalation of soil derived dusts	Construction workers	Low/Moderate	Construction workers may be exposed to areas of landfill waste during future excavation. Any future excavation work would adopt appropriate site management protocols and PPE.
24			Future maintenance workers	Low/Moderate	Maintenance workers may be exposed to areas of landfill waste during future excavation. Any future excavation work would adopt appropriate site management protocols and PPE.
25			Users of future development – general public/workers	Low	The future development will either be hardstanding or include an engineered cover layer, therefore there is unlikely to be any contact with the Made Ground.

PPL No.	Sources	Pathways	Receptors	Qualitative Assessment of Risk	Justification of Qualitative Assessment of Risk
26			Adjacent site users (e.g. residential housing and other buildings on Luton Airport)	Moderate	There is the potential for soil derived dusts which contain contaminants to be generated during construction works. The GI indicated that the levels of contaminants in the landfill are not significantly elevated. However, further site investigation is required to confirm the findings. Good site management practices and mitigation measures would reduce the potential risk. Any future works should have appropriate Management Plans in place.
27		Inhalation of vapours	Construction worker	Low/Moderate	Risk to construction workers and future maintenance workers is considered to be lower than future users as exposure is likely to be in outdoor air and therefore vapours will be diluted.
28			Future maintenance workers	Low/Moderate	
29			Users of future development – general public/workers	Low/Moderate	Volatile contaminants may accumulate within indoor air in future buildings. The risk assessment suggests that there are not significant concentrations of volatile contaminants presented within the landfill. However, this is based on limited monitoring and further GI and monitoring should be undertaken to confirm the results.
Off-site					
30	**Contaminants in groundwater associated with Luton Airport**	Lateral migration in groundwater onto site	Principal aquifer in Chalk	Moderate	Contaminants in groundwater from the adjacent site may migrate onto site. The results of the risk assessment suggest that the groundwater beneath the landfill may be affected by the low level 'halo' of chlorinated solvents which is present in the Luton and Dunstable area. Further site investigation and monitoring is required to confirm that the source of the chlorinated solvents is from an off-site source.

Appendix B

Supplementary gas and groundwater sampling and monitoring programme

Groundwater and Gas Monitoring Specification

SPECIFICATION

This specification sets out the requirements for monitoring existing borehole installations as described in the following Schedules:

Schedule 1: Information

Schedule 2: Scope of Works

Schedule 3: Method

Schedule 4: Chemical Testing Requirements

Annex A: Bill of Quantities

SCHEDULE 1: INFORMATION

S1.1 Location

The site is a former landfill located adjacent to London Luton Airport. This site is approximately 53 hectares and is located 2.5km south east of Luton, located off Eaton Green Road at Grid Reference TL 125218. The location is shown in Figure 1.

The landfill accepted waste from circa late 1930s until 1990s. Site investigation has shown that there is no basal liner to the landfill but a non-engineered cap is present in some areas of the site. A ground investigation was undertaken in 2016-2017, which involved the installation of a number of gas, groundwater and leachate monitoring wells. Initial monitoring was undertaken as part of this investigation work. Further monitoring now is required at the site to determine ground gas and contamination conditions.

The monitoring work is being carried out on behalf of London Luton Airport Limited (LLAL).

S1.2 Objectives

The objectives of the monitoring include:

- To establish whether there is any migration of contaminants from the landfill site and characterise their spatial extent;
- Determine the direction, rate and variability of groundwater flow and contaminant migration;
- Determine the baseline groundwater level, including variability and trends; and

- Determine baseline groundwater quality including variability and trends; and
- Determine baseline gas concentrations including variability and trends.

S1.3 Terms of contract

The terms of contract will be NEC4 Engineering and Construction Short Contract. Details to be agreed with the successful tenderer.

SCHEDULE 2: SCOPE OF WORKS

S2.1 Scope

Monitoring for a period of 12 months at the site is required. Arup will review the monitoring results with regulators after 3 months and reserve the right to reduce or increase the frequency or duration of monitoring required. However for costing purposes it assumed that the following monitoring is required over a 12 month period as follows:

- Monthly monitoring for groundwater levels and samples taken at 17 groundwater quality monitoring points (GQMP);
- Monthly monitoring at 9 gas monitoring points and bulk gas/VOC samples taken every 2 months;
- Monitoring of leachate thicknesses and sampling every 2 months at 4 leachate monitoring wells; and
- Obtaining samples of non-aqueous phase liquids, where present.

The monitoring points are shown on Figure 2. The coordinates for the monitoring points are as follows:

Borehole ID	Easting	Northing	Elevation	Well depth (mbgl)	Monitoring location type
ARP16-LF-BH01	512374	222198	150.17	57.50	Groundwater
ARP16-LF-BH02	512174	221830	154.86	58.00	Groundwater
ARP16-LF-BH03	512189	222058	149.78	55.00	Groundwater
ARP16-LF-BH04	512353	221803	154.52	59.00	Groundwater
ARP16-LF-BH05	512400	221243	153.01	58.00	Groundwater
ARP16-LF-BH08	512619	221794	152.51	57.00	Groundwater
ARP16-LF-BH10	512819	221592	139.34	56.00	Groundwater
ARP16-LF-BH13	512854	221755	129.98	35.00	Groundwater
ARP16-CP-BH11	512854	222155	147.64	39.00	Groundwater
ARP16-CP-BH12	512955	221656	135.88	41.10	Groundwater
ARP16-CP-BH24	513155	221655	136.56	42.50	Groundwater
ARP16-CP-BH27	513254	222355	148.12	53.70	Groundwater
ARP16-CP-BH29	513254	221955	139.48	44.3	Groundwater
ARP16-CP-BH32	513254	221355	136.28	41.00	Groundwater
ARP16-CP-BH50	513654	221555	120.78	23.50	Groundwater
ARP16-CP-BH51	513668	221969	125.82	32.00	Groundwater
ARP16-CP-BH55	512858	221991	146.79	52.70	Groundwater
ARP16-LF-BH03G	512190	222057	149.84	6.00	Gas
ARP16-LF-BH04G	512352	221805	154.45	6.00	Gas
ARP16-LF-BH05G	512400	221245	153.02	6.00	Gas
ARP16-LF-BH08G	512619	221794	152.51	6.00	Gas

Borehole ID	Easting	Northing	Elevation	Well depth (mbgl)	Monitoring location type
ARP16-LF-BH10GA	512818	221591	139.39	5.00	Gas
ARP16-LF-BH06	512446	221556	155.92	13.00	Gas and Leachate
ARP16-LF-BH07	512491	221920	152.94	21.00	Gas and Leachate
ARP16-LF-BH09	512637	221568	153.16	14.00	Gas and Leachate
ARP16-LF-BH12A	512825	221665	146.26	11.00	Gas and Leachate

S2.2 Access

The Contractor shall in advance of each visit give notice of at least 7 working days to LLAL. Permits may be required for visiting certain boreholes (which lie within the airport boundary), sufficient time should be allowed for agreeing permits in advance. The successful tenderer will be given details of the requirements in this regard.

S2.3 Health and Safety

Not less than 14 days before the start of the first groundwater monitoring visit on the Contractor shall submit to Arup a statement of work describing in full the arrangements and methods the Contractor proposes to adopt in carrying out the site operations including full details of safety precautions. In addition, the statement of work shall incorporate a safety plan that includes, but is not limited to, the following:

- Specification for personal protective equipment to prevent ingestion of, inhalation of and skin contact with contaminated materials.
- Statement of safe working practices which will be employed to avoid or minimise contact with contaminated materials.
- Details of health and safety training undertaken by all levels of the work force.

The Contractor shall not subsequently amend the statement of work or any working practice or procedure contained therein without the prior consent of Arup.

S2.4 Risk assessment

The following table (overleaf) presents a risk assessment prepared by the designer of the monitoring strategy presented in this Specification. This table focuses on risks that are particular to the planned scope of work at this site.

Perceived risk	Mitigation	Responsibility
Uneven working areas – risk of injury to site users	Appropriate PPE and caution to be used when moving around the site	Contractor
Contamination in groundwater/leachate samples – risk of illness from contact with contaminants	Contractor to provide suitable PPE for sampling leachate	Contractor
Potential for ground gases – risk of explosion or asphyxiation from gas accumulation	All working areas to be designated 'no smoking' zones. Appropriate measures and caution to be used when gas monitoring/sampling.	Contractor
Security – risk of injury to site personnel from general public	Contractor to liaise with site owners as appropriate and avoid confrontation	Contractor

SCHEDULE 3: METHOD

The contractor shall use the following methods for monitoring and sampling.

S3.1 Groundwater and Leachate Levels

During each groundwater monitoring round, the Contractor shall investigate the presence of NAPL (prior to any purging) using an interface probe. At all groundwater installations an interface probe shall be used to determine the following:

- LNAPL surface level;
- groundwater surface level;
- DNAPL surface level.

The groundwater level shall be recorded relative to the top of the standpipe. The level of the top of the standpipe shall be determined quarterly.

No NAPL has been recorded at the site to date. However where NAPL is encountered, Arup shall be contacted immediately with details of its location and measured thickness. Arup will provide instruction at this stage for any additional sampling required. A rate should be provided in the bill of quantities for provision of the recovery and sampling of least one NAPL sample per monitoring round.

All groundwater monitoring probes and digital readout units shall be calibrated prior to monitoring visits according to their manufacturer's recommendation and at least at intervals not exceeding one month.

The measurements of the thickness of leachate within the leachate monitoring wells shall be undertaken with a probe suitably resistant to leachate.

The instrument readings shall be recorded on approved record sheets and submitted to Arup by 12.00 noon on the day after the readings were taken.

The following records shall be made for each set of readings:

- type of instrument
- instrument reference
- date and time of readings
- personnel taking the readings
- identification and reference of readout equipment used
- individual readings
- weather
- nearby construction activity or earthworks

- any other pertinent remarks.

S3.2 Sampling

S3.2.1 Groundwater

Groundwater samples shall be taken at the locations indicated in Figure 1 during each round of monitoring using micropurging techniques and field measurements using a flow cell. Samples shall be taken once the flow cell readings have stabilised.

The requirements of BS 10175 and BS 5667 apply to all water samples.

The measurements required from the flow cell are as follows:

Test	Units	Detection Limit	Degree of accuracy
pH	pH units	0.1	±0.1
Temperature	°C	0.1	±0.1
Dissolved oxygen	mgO_2/l	0.1	±0.1
Electrical conductivity	µS/cm	10	±2.0
Redox potential	mV	±1	±0.1

The time of sampling and carrying the test shall also be submitted.

Groundwater samples shall be stored in the dark at 4°C±2°C. Testing for Biological Oxygen Demand (BOD), Chemical Oxygen Demand (COD) and Ammoniacal Nitrogen shall be started within 24 hours of sampling.

Care shall be taken to ensure that no cross-contamination occurs either during extraction of the water sample from the sampling well (or water body) or whilst the sample is stored and handled prior to analysis. Depending on the suite of chemical or biological tests to be undertaken, several sub-samples of water may be required, using different types and sizes of container. Water samples shall be chemically fixed with an appropriate agent where necessary. Unless otherwise specified, water samples shall be filtered through a 0.45 micron membrane filter on site before any preservation fixing agents or techniques are applied.

Sufficient water samples shall be taken to allow laboratory testing of the parameters and to the detection limits detailed in Schedule 4.

S3.2.2 Ground Gas

Ground gas monitoring shall be undertaken using suitable equipment which is consistent with the requirements of BS 8576: 2013. Concentrations of methane and carbon dioxide shall be measured using infrared monitoring equipment.

The following gases shall be measured:

- flammable gases;

- hydrogen sulphide;
- carbon dioxide; and
- oxygen.

The monitoring equipment shall be capable of measuring gas concentrations to the following degrees of accuracy:

Gas type	Units	Degree of accuracy
Flammable Gases (incl. Methane)	%LEL	1.0
	%v/v	0.1
Hydrogen Sulphide	ppm	0.5
Carbon Dioxide	%v/v	0.1
Oxygen	%v/v	0.1

The procedure shall be as follows:

1. Measure initial barometric pressure, ambient temperature and differential gas pressure in the standpipe.
2. Take initial gas concentration measurements from each tap valve with portable gas monitoring equipment. Record gas concentrations 5s, 30s and 60s after opening each valve taking readings at one-minute intervals until steady values are achieved or for a maximum of 10 minutes.
3. Take a gas/vapour sample for subsequent laboratory analysis in accordance with the schedule detailed in Schedule 2.1.
4. Carry out gas flow measurements. Attach gas flow measuring device to the top valve and take measurements at 1 minute intervals for a period of not less than 10 minutes, unless gas flow is exhausted. Gas flow displacement measurements in units of l/hr. The detection limit shall be 0.1.
5. Measure atmospheric pressure at the end of the procedure.

The information to be submitted shall be:

a. location and reference number of hole
b. depth of monitoring
c. weather conditions during monitoring, including ambient air temperature
d. standpipe installation details
e. depth to water
f. equipment used
g. operator name and responsibility
h. gas concentrations in the units described in the table above

i. atmospheric pressure in units of millibars

j. Differential gas pressure measurement in units of mm water gauge. The sensitivity shall be 0.5.

S3.2.3 Leachate Sampling

Leachate samples shall be taken at each of the locations specified in Schedule 2.1.

The procedure shall be as follows:

1. Measure the thickness of leachate in the borehole
2. Where sufficient thickness is present for a sample to be taken, this shall be taken using a suitable collection method i.e. a disposable bailer.

S3.2.4 Bulk Gases/ Vapour

Samples for bulk gases and vapours will be undertaken from the gas monitoring locations at the frequency specified in Schedule 2.1. Samples shall be taken using a pressurised sampling vessel such as summa canister. Where a pressurised canister is not appropriate for the analytical measurement of the contaminant, an alternative method should be proposed. A method statement for sampling shall be submitted to Arup prior to sampling for approval.

S3.2.5 Labelling, protection and transportation of samples

All sample storage, labelling, preservation (including temperature control and protection from light) and handling shall be in accordance with BS 10175.

The Contractor shall be responsible for the protection of all samples and for their transport, including loading and unloading.

Containers for water samples shall be opaque and shall be sufficiently robust to avoid being damaged during handling and transportation, and shall not react chemically with the sample. Containers for bacteriological sample collection shall be sterile.

S3.3 Chemical testing requirements

S3.3.1 Schedules

A blank chemical test schedule in excel spreadsheet format shall be provided to Arup within 24 hours of sampling. This shall include the following information:

- Borehole number
- Sample type
- Sample depth (where relevant)

And on the other axis the following shall be listed:

- All suites of chemical tests identified with quantities.

The results of the monitoring works shall be provided as follows:

- All site measurements within 24 hours of the site visit; and
- Chemical test results within 10 working days of receipt of schedules.

S3.3.2 Provision of Data

All data from groundwater installations shall be provided in electronic format using non-write protected Microsoft Excel® spreadsheets.

All data from monitoring and analysis shall also be presented in AGS digital format.

S3.3.3 QA/QC

An allowance shall be made in the costs for field QC blanks and duplicates, suggested allowance of 10% of samples initially, reducing to 5% after an initial characterisation period (assume 3 months for purposes of costs). Separate QC samples are needed for leachate and groundwater.

Allowance shall also be made for obtaining at least one sample per round from multiple levels within the boreholes. This shall consist of three samples; one from the top, one from the middle and one from the bottom of the water column. This is to allow assessment of intra borehole variability.

Arup reserve the right to undertake an audit of the field monitoring and/or laboratory during the period of the contract.

SCHEDULE 4 – CHEMICAL TESTING REQUIREMENTS

The following contaminants are required to be tested for on the groundwater samples. **Please note the detection levels required**.

S4.1 Groundwater analysis required

Determinand	Detection level required µg/l (unless stated otherwise)	Test method offered[1]	Accreditation offered[1]

Project title	Luton Airport Expansion	Job number	245580-00
Meeting name and number	EA Meeting 26th March 2018	File reference	
Location	EA Offices, Welwyn Garden City	Time and date	1400 26 March 2018
Purpose of meeting	Discuss GI strategy and EIA DCO scoping		
Present	[redacted]		
Apologies			
Circulation	Those present		

Action

1. Luton Airport Expansion

YM presented the high level proposals for the expansion plans. No fixed masterplan yet but likely to involve at least part of the landfill. The proposed Century Park development is still currently proposed to go ahead. Phasing of the Century Park development with the expansion works is currently being looked at. YM will update on proposed plans as soon as more details are available.

YM to provide update on proposals once more details available

2. EIA Scoping

JR presented the proposed scoping approach for the water resources EIA chapter for the DCO.

Agreed to include water quality as part of the water resources chapter with signposts to relevant sections of the soils and geology chapter

Agreed that assessment work will include detailed hydrogeological and contaminant transport modelling. Will be informed by the proposed GI works.

Flood risk not too much of a concern from EA perspective, main issue is surface water drainage

Prepared by [redacted]

3.	**Groundwater monitoring programme**	
	Updated EA on status of this.	
	Arup to set up way of providing monitoring data to EA, look to set up a web viewer which includes raw data and summary of any significant results for each round.	
4.	**Ground investigation strategy**	
	Leachate – discussed request for upflow percolation testing of soils. KS stated this is the ideal test for assessing leachate as the standard batch test is less conservative but does realise it is expensive and not many labs which undertake this testing. KS to provide further information on upflow percolation tests. Stated that would be best to consider tiered approach to testing with batch tests for a larger number of samples and then more detailed testing on selected samples where potential leachate issues identified	KS to provide further information on most suitable test
	Packer Testing – KS suggested obtaining groundwater samples from each test horizon to obtain information on stratification of water quality within chalk	Arup to look into sampling groundwater during packer tests
	Trial pits – need to identify if any evidence of leachate identified during excavation. If significant leachate identified in trial pits obtain samples of this.	Arup to include requirement for sampling of leachate in TPs in GI
	EA would be keen to attend site during the GI and in particular would be interested to observe trial pits, packer tests and on-site forensic analysis	YM to advise KS when dates of GI known
	No particular approvals or permits are required for GI from the EA, however they would want to review method statements for GI and some agreement may be required for packer testing once know volumes of water may be dealing with	Arup to provide EA with details once received
	Overall EA appeared to be happy that the proposed GI strategy was comprehensive and should obtain the level of data they would be expecting	
5.	**Water Framework Directive (WFD) Assessment**	
	Arup identified that a WFD compliance assessment is likely to be required as part of the overall assessment. It was recognised that the assessment methodology has not yet been defined due to the early stage of the project but that when it is ready it will need to be agreed with the EA	KM to identify relevant contact to discuss WFD issues with
6.	**Future meetings**

1 INTRODUCTION

Ground Investigation works were undertaken at the Former Eaton Green Landfill site by AECOM. Luton Airport had a key role in World War II and aircraft were manufactured at the nearby former Percival Works. Historically aircraft dials have been painted with radionuclides such as radium (Ra-226) to make them luminous. Therefore, given the history of the area, further specialist investigation of the former landfill was warranted to confirm whether any radioactivity was disposed of at the site. To support ground investigation works, Nuvia were contracted by AECOM to provide radiation protection monitoring. During these works three locations were noted to have above background radiation readings and where reported in Nuvia Radiation Advice Note 72786/AN/001: TP224 (identified 25 June 2018), BBH207 (identified 14 July 2018) and TP273 (identified 18 July 2018). Note that the highest radiation dose rate measurement recorded (TP224) was 0.25 microSvh^{-1}. To put these radiation levels in perspective, someone taking a return flight to Spain would receive a radiation dose of around 10 microSv due to elevated cosmic radiation, hence the external radiation hazard in these areas is low.

Radiation readings approximately 2-3 times background were recorded at locations TP224 and BBH207. At TP224 the elevated readings were detected at the surface, and no ground was broken, whereas the elevated radiation readings at BBH207 were detected during hand digs and the trial pits abandoned and excavated material backfilled.

Radiation readings around 2-3 times background where recorded at location TP273 so the location of the trial pit was moved approximately 8 m. However, readings around 2 times background were detected at a depth of approximately 30 cm in the new location; though it should be noted that no elevated readings were observed in the excavated spoil and the trial pit work could continue.

This report details the further investigation works carried out in these areas of interest (TP224, BBH207 and TP273) to establish whether remediation work is necessary.

2 METHODOLOGY

2.1 Groundhog Survey

To investigate the three areas, a non-intrusive large area surface gamma survey was conducted around each location using Nuvia's Groundhog system.

Nuvia's Groundhog system comprises a 76 x 76 mm sodium iodide (NaI) detector coupled to an advanced gamma radiation spectrometer. The detector and spectrometer are mounted in a carbon fibre composite case, to reduce the weight of the detector and to improve the transmission of low-energy gamma radiation. The detector and spectrometer are connected to an Ultra-Mobile PC carried by the operator. A mapping-grade GPS is used to calculate the position of every radiation measurement with sub-metre accuracy. Measurements are taken along transects and a measurement is recorded automatically every second, so that on average there is one full spectral measurement in every square metre of the survey area, *i.e.* a high density of survey measurements. After surveying, the data is downloaded onto a PC and processed to produce high resolution contour maps of the gamma radiation levels using Geographical Information Systems (GIS).

Nuvia uses the ESRI ArcGIS software and has extended it to improve the analysis of radiation survey data. These features include the ability to select, group and analyse the gamma radiation spectra, where we can

identify radionuclides such as Ra-226, *i.e.* sum spectra over arbitrary domains, in time and space; as individual spectra are rarely of use, typically with only 200-300 counts.

Completion of a Groundhog survey at each area allowed for the location of any elevated radiation levels at the surface and to establish whether activity was localised or distributed across a large area. The information gained by the Groundhog survey was then used to target sampling.

2.2 Sampling

If an area of elevated activity was detected during the Groundhog survey, then sampling was targeted at these locations. However, if no elevated readings were noted then sampling was conducted at the original location of the trial pit/borehole.

Trial pits were excavated to a depth of approximately 30 cm at each sampling location and the same Health Physics (HP) instrumentation used in the original surveys, were used to scan arisings as they were produced. If spoil was found to have elevated radiation readings, then that material was selectively sampled.

2.3 High Resolution Gamma Spectrometry (HRGS)

Samples were analysed using Nuvia's HRGS system which comprises a detector, multi-channel analyser (MCA) and laptop.

The detector medium for the HRGS system is a crystal of germanium which is electrically cooled to below -173°C. The system is manufactured by Canberra and is a Falcon 5000 Broad Energy Germanium (BEGe) 2830, serial number 13000222.

The MCA digitises the signals from the detector and converts it into an energy spectrum that can be analysed using software installed on the laptop. The unit is set-up to acquire a gamma spectrum over 8192 channels and the default energy window for the system is 0 to 2700 keV. A feature of the Falcon 5000 is the integration of the MCA into the detector housing, so that the only hardware connected to the detector is the laptop. All operations are carried out using software commands from the attached laptop via an ethernet cable.

The detector's detection characteristics are defined, allowing mathematical modelling software to be utilised to determine its efficiency without the need for radioactive sources. Efficiency calibrations are generated using Canberra's In-Situ Object Counting System (ISOCS) Geometry Composer modelling software version 4.4.

The detector was elevated to view the mid-point of each sample under investigation and the sample placed on a small turntable; the turntable allowing the detector to view all around the sample and essentially smooth out variations in activity distribution.

Each Sample was analysed for 30 minutes whilst on-site, to screen them for transport back to Nuvia's Harwell office and to provide rapid evaluation as to whether significant contamination was present. Once returned

to Harwell the samples were analysed for 8 hours each, to reach the limits of detection required to assess their activities relative to background levels.

3 INVESTIGATION RESULTS

3.1 TP224

The surface radiation map produced by the Groundhog survey can be seen in Appendix 1. Though radiation levels can be seen to fluctuate across the area, the survey doesn't show any notable features; background fluctuations to this degree are expected.

A shallow trial pit was therefore excavated at the location of TP224, along with HP monitoring of excavated spoil and the trial pit. No readings above background were detected from the excavated spoil and count rates less than twice background were recorded in the excavation itself (Appendix 4). A representative sample from the excavation was taken for HRGS analysis.

HRGS analysis of the samples showed no artificial radionuclides to be present and natural radionuclides to be below the Minimum Detectable Activity (MDA). The result for radium, and its short-lived daughters' bismuth and lead, are shown in Table 1.

Table 1: HRGS results for sample TP224 (Bq/g).

Nuclide	Result	Uncertainty	MDA
^{214}Bi	Not Detected	n/a	3.52E-02
^{214}Pb	Not Detected	n/a	2.90E-02
^{226}Ra	Not Detected	n/a	3.30E-01

3.2 BBH207

The surface radiation map produced by the Groundhog survey can be seen in Appendix 2. Though radiation levels can be seen to fluctuate across the area, the survey doesn't show any notable features; background fluctuations to this degree are expected.

A shallow trial pit was therefore excavated at the location of BBH207, along with HP monitoring of excavated spoil and the trial pit. No readings above background were detected from the excavated spoil and count rates less than twice background recorded in the excavation itself (Appendix 4). A representative sample from the excavation was taken for HRGS analysis.

HRGS analysis of the sample showed no artificial radionuclides to be present. Radionuclides in the natural chains were also found to be below the Minimum Detectable Activity (MDA) except for radium's short-lived daughters' bismuth and lead. The result for ^{226}Ra, ^{214}Bi, and ^{214}Pb, are shown in Table 2.

Table 2: HRGS results for sample BBH207 (Bq/g).

Nuclide	Result	Uncertainty	MDA
^{214}Bi	5.13E-02	1.35E-02	n/a
^{214}Pb	4.21E-02	1.18E-02	n/a
^{226}Ra	Not Detected	n/a	1.95E-01

3.3 TP273

The surface radiation map produced by the Groundhog survey can be seen in Appendix 3. From this survey two noticeable features can be identified where count rates appear to decrease away from a central location: identified as TP273N and TP273S.

Shallow trial pits were excavated at both locations, along with monitoring of excavated spoil and the trial pit. No readings above background were detected from the excavated spoil at either location but count rates in the region of 2-3 times background where recorded in the excavation itself at TP273S (Appendix 4). Samples from the excavation were taken for HRGS analysis.

HRGS analysis of the samples showed no artificial radionuclides to be present. Radionuclides from the natural chains were also found to be below the Minimum Detectable Activity (MDA) in the sample taken from TP272N, except for radium's short-lived daughter bismuth. The results for ^{226}Ra, ^{214}Bi, and ^{214}Pb, for this sample are shown in Table 3.

Table 3: HRGS results for sample TP273N (Bq/g).

Nuclide	Result	Uncertainty	MDA
^{214}Bi	2.50E-02	1.50E-02	n/a
^{214}Pb	Not Detected	n/a	2.03E-02
^{226}Ra	Not Detected	n/a	1.58E-01

Radium's short-lived daughter bismuth and lead were detected in the sample taken from TP273S. The results these radionuclides are shown in Table 4.

Table 4: HRGS results for sample TP273S (Bq/g).

Nuclide	Result	Uncertainty	MDA
^{214}Bi	3.98E-02	1.77E-02	n/a
^{214}Pb	6.36E-02	1.46E-02	n/a
^{226}Ra	Not Detected	n/a	2.17E-01

4 DISCUSSION

Of the locations re-visited, only TP273S was found to have a count rate in excess of twice background. It should be noted that this reading was observed within the excavation. This could therefore be explained by the increase in material surrounding the detector rather than from the presence of contamination; increased volume of material surrounding the detector increasing the detectable activity from naturally occurring radioactive materials.

The failure to replicate the count rates originally observed can be explained by the ground conditions at the time of the surveys. This is due to the original survey having been conducted in dry conditions and the return surveys conducted in wet conditions; high moisture content in soils resulting in a reduced count rate.

4.1 Sample Results

Radium is a low probability, low energy, gamma emitter so has a high limit of detection. However, its short-lived daughters ^{214}Bi and ^{214}Pb are readily detectable by HRGS and by accounting for the loss of activity, due to the loss of the gaseous ^{222}Rn, following the decay of ^{226}Ra, can be used to infer the activity of ^{226}Ra in the sample. Typically, a radon loss of 30% is assumed to infer the activity of radium present (Table 5).

Table 5: Inferred ^{226}Ra activities for each sample (Bq/g).

Sample	Result	Uncertainty	MDA
TP224	Not Detected	n/a	4.14E-02
BBH207	6.67E-02	1.81E-02	n/a
TP273N	3.56E-02	2.15E-02	n/a
TP273S	7.39E-02	2.31E-02	n/a

^{214}Bi and ^{214}Pb ought to be in equilibrium due to their short half-lives but heterogeneity within the samples can result in a discrepancy between their results. Therefore, where both are detected, an average of the two results has been used to infer the radium concentration shown in Table 5.

Background radiation concentrations in natural ground vary depending on the composition of the soil in question but are typically in the range of 0.03 – 0.07 Bq/g for ^{226}Ra. However, the samples taken are all from made ground which was noted to contain brick, cinders and concrete. This explains the slightly elevated readings observed in the sample taken from BBH207 and TP273S; clay bricks observed to contain up to 0.2 Bq/g ^{226}Ra [1].

5 SUMMARY

Only the survey of the area surrounding TP273 observed any notable features and targeted samples were taken from these features together with samples from TP224 and BBH207. Analysis of the HRGS results show the levels observed are consistent with expected natural background levels and are therefore of no concern.

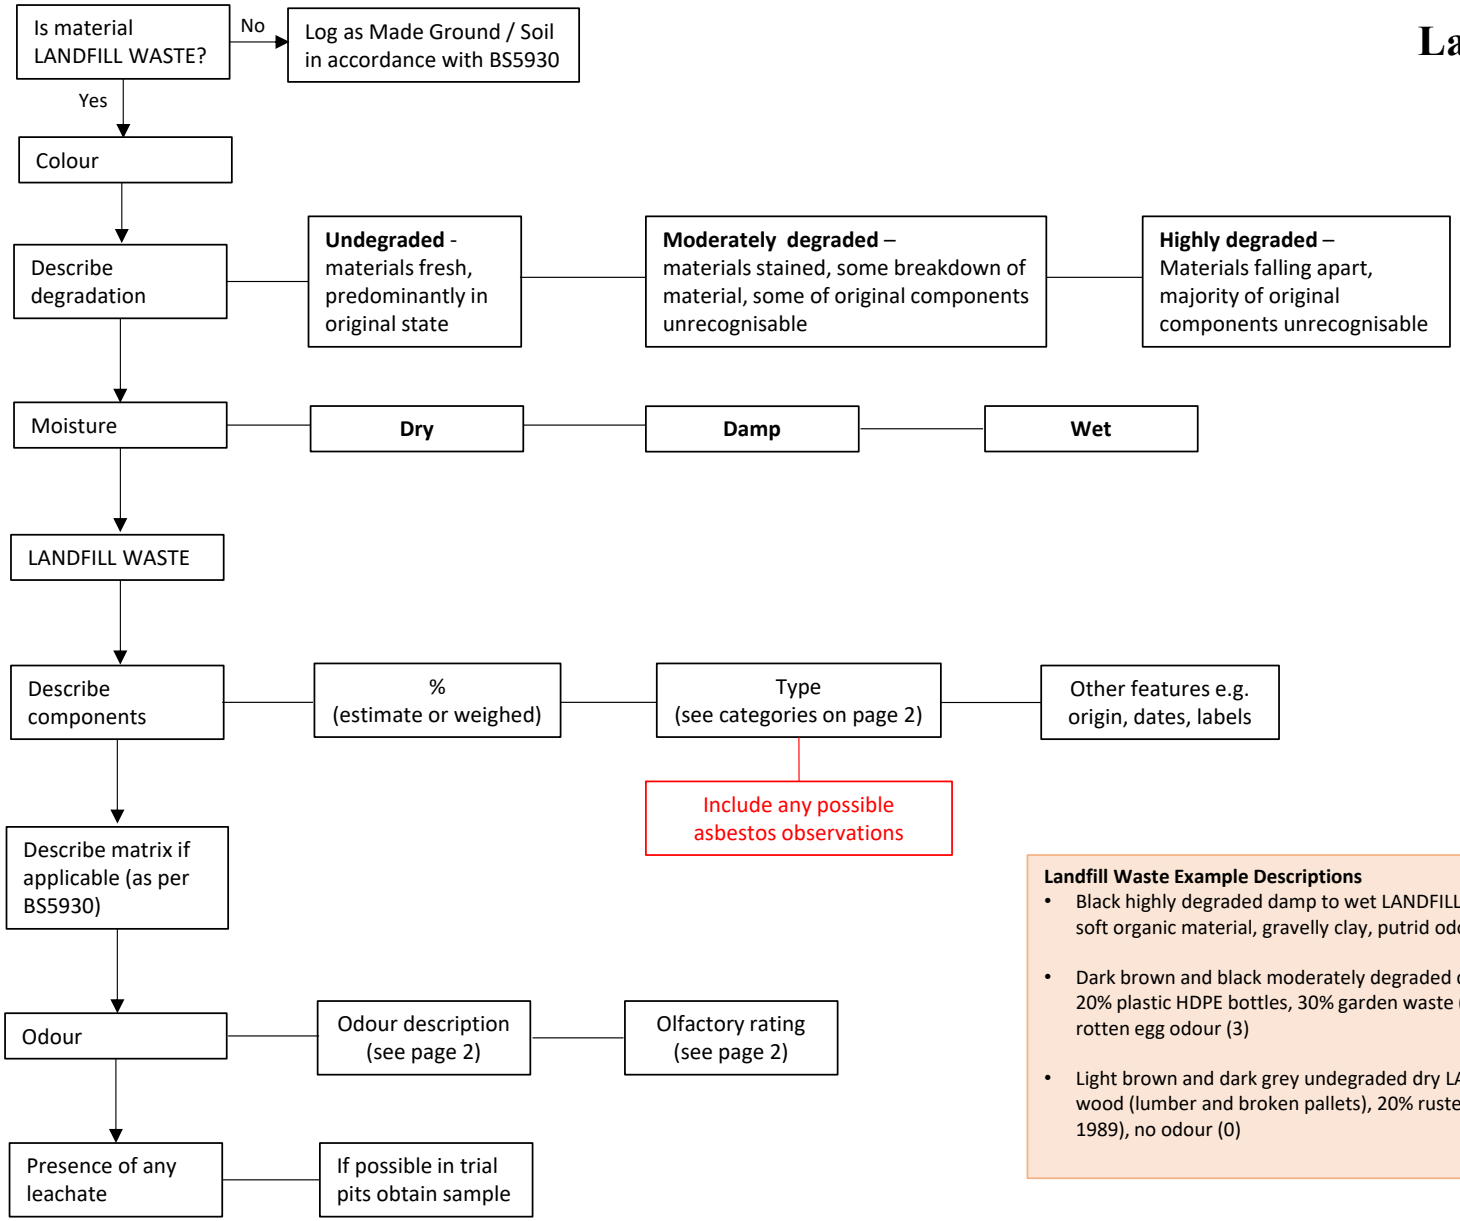
Appendix D - Landfill Waste Characterisation

Appendix D

D1 Landfill Logging Protocol

Landfill Waste Logging



Landfill Waste Example Descriptions

- Black highly degraded damp to wet LANDFILL WASTE comprising 5% aluminium cans, 15% black plastic bags, 80% unidentifiable soft organic material, gravelly clay, putrid odour (2), minor seepage of leachate at 3.5m
- Dark brown and black moderately degraded dry LANDFILL WASTE comprising 20% mixed paper (includes magazine dated 1978), 20% plastic HDPE bottles, 30% garden waste (branches and twigs), 10% clear glass bottles, 10% corrugated boxes, 10% sand, rotten egg odour (3)
- Light brown and dark grey undegraded dry LANDFILL WASTE comprising 50% other inorganics (25% concrete, 25% brick), 20% wood (lumber and broken pallets), 20% rusted iron nails, 5% tin can (500ml with creosote label), 5% newsprint (newspaper dated 1989), no odour (0)

Waste Component Categories - Adapted from *ASTM D5231-92 (2016)*)

Waste Component Categories	Description
Mixed paper	Office paper, computer paper, magazines, glossy paper, waxed paper and other paper not fitting the categories of newsprint and corrugated
Newsprint	Newspaper
Corrugated	Corrugated medium, corrugated boxes or cartons and brown (kraft) paper (that is corrugated) bags
Plastic	All plastics - PET bottles, HDPE bottles, film, other plastics
Garden waste	Branches, twigs, leaves, grass and other plant material
Food waste	All food waste except bones
Wood	Lumber, wood products, pallets and furniture
Biological	Clinical waste, veterinary waste
Other organics/ combustibles	Textiles, rubber, leather and other primarily burnable materials not included in above categories
Construction waste	Concrete, brick, tiles, plaster, tarmac, bitumen
Ferrous	Iron, steel, tin cans and bi-metal cans
Aluminium	Aluminium, aluminium cans and aluminium foil
Glass	All glass - clear, brown, green
Other inorganics/ non-combustibles	Rock, sand, dirt, ceramics, non-ferrrous non-aluminium metals (copper, brass etc), bones, ash, clinker, slag

Descriptive terms for odours (From D.Norbury, 2016)

Category	Descriptive terms
Camphor	Bitter Mothballs Acrid
Musk	Penetrating Pungent
Floral	Wide range of terms, not likely to be used often in Made Ground
Peppermint	Sweet Minty
Ether	Solvent Acetone Medicinal
Vinegar	Sharp Acetic Pungent Rancid
Putrid	Rotten egg Rotten cabbage Fishy Disagreeable, sweet Sulphurous
Hydrocarbon	Organic Petrol Diesel Oil Asphalt Tar

Olfactory rating

Rating	Olfactory observations
0	No odour
1	Faint odour
2	Distinct but not strong
3	Strong odour
4	Strong odour discernible in ambient air
5	Very strong odour very discernible in ambient air

Appendix D
Methodology for Forensic Waste Logging

D3 Introduction

D3.1.1 This document outlines the methodology undertaken by Geotechnical Engineering Ltd (GEL)/AECOM during the 2018 Landfill Ground Investigation.

D3.1.2 The process of forensic logging was overseen by Arup throughout the ground investigation.

D4 Methodology

D4.1 Sample Selection

Boreholes

D4.1.1 Borehole samples were selected either by the AECOM supervising engineer or Arup engineer.

D4.1.2 The samples selected were continuous runs of similar looking material, not based on logs or descriptions (as these were not readily available at the time), from core boxes.

D4.1.3 An example of a chosen borehole sample is shown below, this example was recorded as BH213 10.50-11.50m:

Trial Pits

D4.1.4 Trial pits samples were collected at the side of the pit by the GEL engineer supervising the trial pitting. The engineers in the forensic lab would then be informed either by the GEL logging engineer or the Arup engineer who shadowed the trial pit which bulk samples were most worth looking at/most representative of the strata encountered.

D4.1.5 The samples were generally one (sometimes two) standard bulk bags in size, variably filled (dependant on the waste encountered). Generally, any partially sharp, large or

potentially dangerous (i.e. syringes etc) objects were excluded from the sample to avoid unnecessary risk of injury to the engineers conducting the forensic logging.

D4.1.6 These samples were recorded as spot samples (i.e. assigned to a single depth, 5.0m) or a short range of depth (i.e. 5.0-5.2m).

D4.2 Sample Processing

D4.2.1 Borehole samples were selected from the core boxes and then removed utilizing (gloved) hands or pallet knifes/scrapers and deposited into a clean metal tray.

D4.2.2 Trial pit samples were emptied from the bulk bag(s) into a clean metal tray.

D4.2.3 If samples were particularly large or predicted to weigh over 13kg (limit of weighing scales) then the sample was split into multiple trays.

D4.2.4 The samples were then photographed within the trays with appropriate labelling, as shown below:

D4.3 Sample Assessment

Initial Assessment

D4.3.1 Samples were then weighed utilizing electronic scales accurate to 4 decimal places (units = kg) and the total weight of the sample recorded.

D4.3.2 The sample was then bulk assessed for its colour, dampness, degradation, odour, odour rating, sample texture and presence of leachate. This is similar to the field landfill waste logging procedure.

D4.3.3 It is noted that odours were hard to assess, given the need to face mask PPE protection during the forensic logging process and therefore weaker odours are likely to have been missed.

Detailed Assessment

D4.3.4 The sample was then picked apart and split into 14 categories of waste components as specified on the Arup landfill waste logging sheet.

D4.3.5 The sample was sifted through a number of time, removing separable components out from the main bulk into separate piles/trays for weighing. Anything remaining after the sifting process was deemed to be 'Other Non-Organics/Inorganics'. Once the engineers were satisfied that sufficient sifting had occurred each waste component was then weighed individually and recorded. Photos were sometimes (but not always) taken of the individual components as a record.

Final Stages

D4.3.6 The individual components were then recombined into one sample, and this was weighed and compared to the initial weight recorded to check for discrepancies (for example if some component was missing etc or errors). If there were any discrepancies noted, then checks would be made and the sample re-processed if necessary.

D4.3.7 Notes would also be made as to whether any asbestos containing material had been identified and the matrix (if present) would be described to BS5930:2015.

D4.3.8 The sample would then be put into a bulk bag and put into storage on site, before being disposed of at the end of the ground investigation.

D4.3.9 Calculations were then conducted to work out the relevant percentages of each waste competent compared to the whole sample. (This process has been conducted automatically when entering the data into the excel spreadsheet from the PDF versions to avoid and errors).

Appendix D
Methodology for Assigning Waste Type

D5 Introduction

D5.1.1 This document aims to set out the methodology utilised during the process of assigning a waste type to each layer of landfill encountered during the 2018 Landfill Ground Investigation.

D5.1.2 Waste types for which landfill material would be categorised into are as follows:

Table 1: Waste Types

Waste Type	Description	Colour Assigned
Non-Chalky Cover	Cover material with a non-chalky matrix	
Chalky Cover	Cover material with a chalky matrix	
Construction Waste	Material from construction projects	
Recent Domestic Waste	Household waste from post-1970	
Old Domestic Waste	Household waste from pre-1970	
Industrial Waste	Factory, scrapyard etc waste	
Commercial Waste	Office and retail waste	

D5.1.3 It is noted that each layer has been assigned one waste type. Though some layers exhibit characteristics of multiple waste types, the most dominant waste type has been chosen. This has been done to simplify the data analysis and creation of the ground model.

D6 Sources of Data for Waste Classification

D6.1.1 The following data sources were viewed and considered in deciding what to classify each waste strata as.

Table 2: Data Sources

Data Source	Description
2018 Landfill GI Exploratory Hole Logs	Borehole and trial pit logs from where landfill waste was encountered.
Arup site team logs	Arup shadow logs / notes generally from Trial Pits, but also some from shadow borehole logging.
GEL/AECOM supplied photos (WVP + LTCP)	Core photos and Trial Pits photos from 2018 Landfill GI.
Arup site team photos	Photos taken by Arup site team during 2018 Landfill GI
AECOM Forensic Waste Descriptions and Photos	Photos and original forensic logging sheets.
Arup Forensic Waste Photos	Photos taken from Arup shadowing forensic logging.

Data Source	Description
Arup – volumes derived from forensic logging	Arup's conversion of forensic values (by weight) from AECOM into volumes.

D7 Non-Chalky Cover

D7.1.1 Non-Chalky Cover has been defined as either material near surface used to "cap" the landfill, or daily capping layers from when the landfill was active. These are largely derived from superficial deposits such as Clay-with-Flints Formation, Dry Valley Deposits etc.

D7.1.2 This material is generally brown or orangish brown in colour and contains flint and more occasionally chalk gravel.

D7.1.3 The majority of these strata are natural materials (other non-organics) mostly soil with some inclusions of construction waste, but (generally) less than construction waste. Small proportions of other waste constituents may also be present within these layers, generally presumed to be from tracking of materials whilst being placed.

D7.2 Typical image and description of Non-Chalky Cover:

Location	Depth	Description
BH218	0.00 – 1.50m bgl	Grass over stiff friable brown slightly sandy slightly gravelly CLAY. Gravel is subangular and subrounded fine to coarse flint. Rare rootlets. (MADE GROUND)

D8 Chalky Cover

D8.1.1 Similarly to Non-Chalky Cover, this material has been defined as either material near surface used to "cap" the landfill, or daily capping layers from when the landfill was active. However, these are largely derived from Chalk rather than superficial deposits.

D8.1.2 Chalky cover is generally white, off-white or grey in colour and containing chalk and more occasionally flint gravel.

D8.1.3 The majority of these strata are natural materials (other non-organics), comprising mostly soil with some inclusions of construction waste but (generally) less than within construction waste. Small proportions of other waste constituents may also be present within these layers, generally presumed to be from tracking of materials whilst being placed.

D8.2 Typical images and descriptions of Chalky Cover:

Location	Depth	Description
BH202A	4.20 – 7.75m bgl	Firm locally soft grey locally mottled white slightly sandy slightly gravelly CLAY. Gravel is subangular and subrounded fine and medium chalk.

Location	Depth	Description
TP229	0.25 – 0.50m bgl	Brown slightly silty gravelly fine to coarse SAND. Gravel is angular to subrounded fine to coarse flint and off-white chalk.

D9 Construction Waste

D9.1.1 Construction Waste was typically encountered near surface as a “cover” layer but was also present throughout the landfill including at significant depths. It was largely derived from reworked natural superficial deposits and was brown or orangish brown in colour.

D9.1.2 Construction Waste was defined by the presence of brick and concrete with a lesser percentage of wood, plastic, glass, ferrous and other organics. However, in a small number of cases brick and concrete may be absent, but other typifying waste items would be present.

Waste Constituent	Typical Items Noted
Construction Waste	Brick Concrete Concrete with rebar.
Wood	Lumber Timber Wooden Posts Chipboard / MDF / Plywood
Plastic	Builders sacks Wrapping from bricks Electrical wiring
Ferrous	Rebar Piping Nails / Screws
Glass	Fragments
Other Organics	Fabric rags Hessian sacks
Other Inorganics	Soil (clay, silt, sand) Natural gravels (flint, chalk) Ceramic pipe Asphalt

D9.2 Photos of typical Construction Waste:

D10 Recent Domestic Waste

D10.1.1 Recent Domestic Waste is any household waste from post-1970. It was most notably encountered within the eastern portion of the playing fields in WVP. It typically was largely formed of “black plastic bag” waste from household bins, mixed with other materials such as materials from skips from house clearances etc.

D10.1.2 Typically, it was brown to dark grey in colour and was typified by the presence of plastic, newspapers and food containers. Where dates were identified this was used to separate the Recent Domestic Waste from Old Domestic Waste. In situations where no date was identified a combination of the types of items within the stratum and the composition of the strata above and below were taken into account.

Waste Constituent	Typical Items Noted
Construction Waste	Brick
Mixed Paper	School books Magazines Manuals
Newsprint	Typically in small numbers, single copies
Wood	Furniture Chipboard / MDF / Plywood
Plastic	Food wrappings – bread, frozen food etc Yoghurt pots Children's toys Shopping bags Bin bags Bottles Washing-up Liquid Bleach Cosmetics containers
Ferrous / Aluminium	Food cans Paint cans Drinks cans – beer and soft drinks Cooking utensils Nails
Glass	Fragments Lightbulbs Bottles Jars
Other Organics	Shoes Clothing Carpet Towels Leather bags, belts etc.
Other Inorganics	Soil (clay, silt, sand) Natural gravels (flint, chalk) Ceramic tile Ceramic and China plates/dishes Broken down material – too small to identify.

D10.2 Photos of typical Recent Domestic Waste:

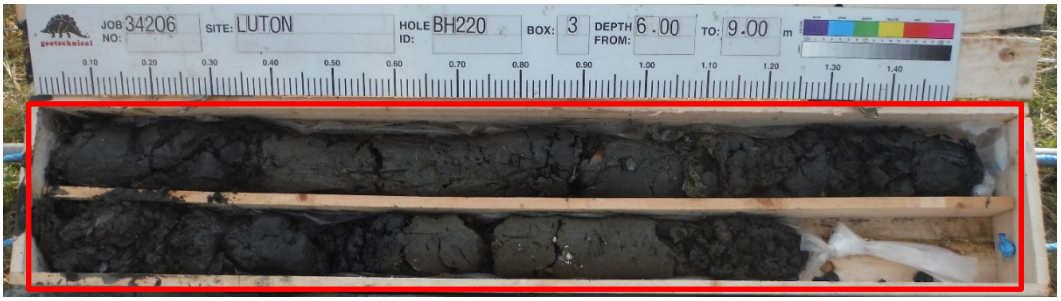
D11 Old Domestic Waste

D11.1.1 Old Domestic Waste is any household waste from pre-1970. It was most notably encountered at depth across the site and in the west of the site in the LTCP. It typically was largely formed of ashy household waste, including newspaper, leather, bones etc. The waste closer to 1970 more resembled Recent Domestic Waste but typically with less plastic.

D11.1.2 Where dates were identified this was used to separate the Old Domestic Waste from Recent Domestic Waste. In situations where no date was identified a combination of the types of items within the stratum and the composition of the strata above and below were taken into account.

Waste Constituent	Typical Items Noted
Construction Waste	Brick
Mixed Paper	Books TV Magazines
Newsprint	Typically in small numbers, single copies, mostly more degraded.
Wood	Furniture Wood fragments
Plastic	Plastic bags Washing up liquid “Hard” plastics
Ferrous / Aluminium	Cans Tins Coins Nails Jar lids Bottle caps
Glass	Fragments Bottles Jars
Other Organics	Shoes Textiles Rubber gloves
Other Inorganics	Soil (clay, silt, sand) Natural gravels (flint, chalk) Tile Ceramic and China plates/dishes Broken down material – too small to identify. Clinker Ash Bone

D11.2 Photos of typical Old Domestic Waste:



D12 Industrial Waste

D12.1.1 Industrial Waste comprised a number of different sources of waste. These strata is largely waste from local factories, garages and the former scrapyard which was formerly in the northwest of the landfill. A number of locations identified waste which is likely to have come from the Vauxhall factory to the west of Luton Airport.

D12.1.2 The Industrial Waste also spans the entire history of the landfill, and therefore is varied in composition. For example, earlier Industrial Waste typically contains more construction waste, ash, clinker and slag than the later industrial waste of the 1960s and 1970s. Brick and concrete were often present in higher quantities in all industrial waste.

Waste Constituent	Typical Items Noted
Construction Waste	Brick Concrete
Mixed Paper	Instruction manuals
Newsprint	Rare newspapers
Wood	Furniture Wood fragments
Plastic	“Hard” plastics Malformed plastic Waste plastic from moulding Rare food wrappings
Ferrous / Aluminium	Scrap metal Car parts Machine parts Cans Tins Steel/iron sheets
Glass	Fragments Bottles Jars
Other Organics	Rubber Foam Tyres Vinyl Fabric scraps and offcuts
Other Inorganics	Soil (clay, silt, sand) Natural gravels (flint, chalk) Tile Clinker Ash

Waste Constituent	Typical Items Noted
	Slag

D12.2 Photos of typical Industrial Waste:

D13 Commercial Waste

D13.1.1 Commercial Waste appeared to typically be office, school or retail waste from shops or the airport. It was characterised by typically greater amounts of mixed paper, newsprint, corrugated, plastic and wood in the form of pallets.

Waste Constituent	Typical Items Noted
Construction Waste	Brick
Mixed Paper	Flight directories Bank statements Pension statements Commercial catalogues Time Cards Magazines
Newsprint	Large stacks of newspapers including the same newspaper repeated several times.
Corrugated	Cardboard boxes Cigarette packages
Wood	Pallets
Plastic	Airline cutlery and food packaging Plastic bags Polystyrene
Ferrous / Aluminium	Ring binders
Glass	Fragments
Other Organics	Fabric Shoes
Other Inorganics	Soil (clay, silt, sand) Natural gravels (flint, chalk)

D13.2 Photos of typical Commercial Waste:

Appendix D
Waste Chemistry

D16 Introduction

D16.1.1 This section presents “Box and Whisker” plots demonstrating the range of concentrations from laboratory results for 14 different representative contaminants.

D16.1.2 The contaminants which have been plotted are as following:

a. Lead;
b. Arsenic;
c. Copper;
d. Mercury;
e. Benzo(a)pyrene;
f. Benzene;
g. Naphthalene;
h. Vinyl Chloride;
i. 1-2 Dichloroethane;
j. 1,3,5-Trimethlybenzene;
k. 1,2,4-Trimethylbenzene;
l. Bis(2-chloroethoxy)methane;
m. Dibenzofuran;
n. Trichloroethene.

D16.1.3 These contaminants have been sorted by a number of filters to show the data in different ways, these are discussed below.

D16.2 Split by Era

D16.2.1 First the data was sorted by “Era” of landfill construction/filling the eras are defined as:

a. **Pre-1947** – earliest period of landfill WWII era;
b. **1947 to 1955** – post war landfill;
c. **1955 to 1960** – period during which the Clean Air Act was introduced;
d. **1960 to 1970** – major phase of landfill, defined by introduction of larger volumes of plastics; and
e. **1970 to 1980** – final stage of landfill defined by large volumes of “black bag waste” before a non-engineered cap was placed.

D16.3 Split by Waste Type

D16.3.1 Secondly the data was sorted by “Waste Type” as defined within the report, the waste types are as follows:

a. **Construction** waste;
b. **Industrial** waste;
c. **Commercial** waste;
d. **Recent Domestic** waste;
e. **Old Domestic** waste;
f. **Chalky** (daily) **Cover**;
g. **Non-chalky** (daily) **Cover**;
h. Non-landfill **Made Ground**.

D16.4 Waste Type split by Era

D16.4.1 The data has also been sorted by a combination of Era and Waste Type.

D16.4.2 First the data was split to show a contaminant within a certain waste type, split by era.

a. Example: **Lead** within **construction** waste split by **era** shows the highest concentration of lead within this type of waste was in 1955 to 1960.

D16.5 Era split by Waste Type

D16.5.1 Second the data was split to show a contaminant within a certain era, split by waste type.

a. Example: **Lead** contamination from between **1947 and 1955** split by **waste type** shows the highest concentration of lead within this era was in old domestic waste.

Appendix E- Human Health Generic Quantitative Risk Assessment

Appendix E

E1 Human Health Assessment Criteria

Screening value	Screening value	Units	ARUP GAC	Justification
General inorganics				
Total Cyanide	24	mg/kg	POS Park	
Complex Cyanides	24	mg/kg	POS Park	
Free Cyanide	24	mg/kg	POS Park	
Phenols				
Cresols	46100	mg/kg	POS Park	No GAC - Cresol is a total of methylphenols (2-methylphenol, 3-methylphenol and 4-methylphenol), therefore the lowest of the GACs for these compounds has been used (2-methylphenol)
Phenol	7600	mg/kg	POS Maintenance	
Trimethylphenol	46100	mg/kg	POS Park	No GAC - 3-methylphenol used
Speciated PAHs				
Naphthalene	193	mg/kg	Commerical	
Acenaphthylene	28900	mg/kg	POS Park	
Acenaphthene	28900	mg/kg	POS Park	
Fluorene	19600	mg/kg	POS Park	
Phenanthrene	6170	mg/kg	POS Park	
Anthracene	149000	mg/kg	POS Park	
Fluoranthene	6300	mg/kg	POS Park	
Pyrene	15100	mg/kg	POS Park	
Benzo(a)anthracene	48.8	mg/kg	POS Park	
Chrysene	91	mg/kg	POS Maintenance	
Benzo(b)fluoranthene	13.2	mg/kg	POS Park	
Benzo(k)fluoranthene	114	mg/kg	POS Maintenance	
Benzo(a)pyrene	10.8	mg/kg	POS Park	
Indeno(1,2,3-cd)pyrene	44	mg/kg	POS Maintenance	
Dibenzo(a,h)anthracene	1.15	mg/kg	POS Park	
Benzo(g,h,i)perylene	612	mg/kg	POS Maintenance	
Heavy metals and metalloids				
Antimony	3290	mg/kg	POS Park	
Arsenic	168	mg/kg	POS Park	
Barium	5770	mg/kg	POS Park	
Beryllium	11.7	mg/kg	Commerical	
Boron	46200	mg/kg	POS Park	
Cadmium	190	mg/kg	Commerical	
Chromium VI	220	mg/kg	POS Park	
Chromium III	33000	mg/kg	POS park	
Chromium Total	8570	mg/kg	Commerical	
Copper	44400	mg/kg	POS Park	
Lead	1300	mg/kg	POS Park	
Mercury	244	mg/kg	POS Park	
Molybdenum	2890	mg/kg	POS Park	
Nickel	804	mg/kg	POS Park	
Selenium	1850	mg/kg	POS Park	
Vanadium	2820	mg/kg	POS Maintenance	
Zinc	173000	mg/kg	POS park	
Monoaromatics				
Benzene	26.6	mg/kg	Commerical	
Toluene	56293	mg/kg	Commerical	
Ethylbenzene	5705.5	mg/kg	Commerical	
Xylenes	6603.1	mg/kg	Commerical	
MTBE	7480	mg/kg	Commerical	
Petroleum hydrocarbons				
TPH >C5-C6 Aliphatics	3190	mg/kg	Commerical	
TPH >C6-C8 Aliphatics	7780	mg/kg	Commerical	
TPH >C8-C10 Aliphatics	2000	mg/kg	Commerical	
TPH >C10-C12 Aliphatics	9690	mg/kg	Commerical	
TPH >C12-C16 Aliphatics	24700	mg/kg	POS Park	
TPH >C16-C21 Aliphatics	455000	mg/kg	POS Park	
TPH >C21-C35 Aliphatics	455000	mg/kg	POS Park	
TPH-CWG - Aliphatic >C16 - C35	455000	mg/kg	POS Park	
TPH-CWG - Aliphatic >C35 - C44	455000	mg/kg	POS Park	
TPH >C5-C7 Aromatics	27	mg/kg	Commerical	
TPH >C7-C8 Aromatics	56294	mg/kg	Commerical	
TPH >C8-C10 Aromatics	3460	mg/kg	Commerical	
TPH >C10-C12 Aromatics	9240	mg/kg	POS Park	
TPH >C12-C16 Aromatics	10200	mg/kg	POS Park	
TPH >C16-C21 Aromatics	7630	mg/kg	POS Park	
TPH >C21-C35 Aromatics	7820	mg/kg	POS Park	
TPH >C35-C44 Aromatics	7820	mg/kg	POS Park	

Screening value	Screening value	Units	ARUP GAC	Justification
VOCs				
Chloromethane	0.956	mg/kg	Commerical	
Chloroethane	901	mg/kg	Commerical	
Vinyl Chloride	0.0594	mg/kg	Commerical	
1,1-Dichloroethene	24.3	mg/kg	Commerical	
Cis-1,2 Dichloroethene	13.6	mg/kg	Commerical	
1,1 -Dichloroethane	263	mg/kg	Commerical	
Trichloromethane	99.1	mg/kg	Commerical	(Chloroform)
1,1,1-Trichloroethane	660	mg/kg	Commerical	
1,2-Dichloroethane	0.671	mg/kg	Commerical	
Trans-1,2 Dichloroethene	20.7	mg/kg	Commerical	
Tetrachloromethane	2.87	mg/kg	Commerical	
1,2-Dichloropropane	3.13	mg/kg	Commerical	
Trichloroethene	1.23	mg/kg	Commerical	
Bromodichloromethane	1.96	mg/kg	Commerical	
1,1,2-Trichloroethane	89.1	mg/kg	Commerical	
Dibromochloromethane	1.96	mg/kg	Commerical	
Tetrachloroethene	18.6	mg/kg	Commerical	
Chlorobenzene	55.6	mg/kg	Commerical	
1,1,1,2-Tetrachloroethane	108	mg/kg	Commerical	
m,p-Xylenes	5923.26	mg/kg	Commerical	
Styrene	3170	mg/kg	Commerical	
Tribromomethane	714	mg/kg	Commerical	(Bromoform)
o-Xylene	6603.1	mg/kg	Commerical	
1,1,2,2-Tetrachloroethane	274	mg/kg	Commerical	
Iso-propylbenzene	1300	mg/kg	Commerical	
Bromobenzene	91.5	mg/kg	Commerical	
Propylbenzene	3860	mg/kg	Commerical	
1,3,5 Trimethylbenzene	39.4	mg/kg	Commerical	No GAC - Arup GAC for 1,2,4-Trimethylbenzene used as surrogate
1,2,4 Trimethylbenzene	39.4	mg/kg	Commerical	
sec-Butylbenzene	26.6	mg/kg	Commerical	No GAC - benzene GAC used as a conservative surrogate.
1,3 Dichlorobenzene	29.9	mg/kg	Commerical	
p-Isopropyltoluene	1300	mg/kg	Commerical	No GAC - EIC GAC for isopropylbenzene used as precautionary surrogate. Isopropyltoluene likely to be less toxic as toluene group rather than benzene
1,2-Dichlorobenzene	2020	mg/kg	Commerical	
1,4 Dichlorobenzene	4220	mg/kg	Commerical	
n-Butylbenzene	26.6	mg/kg	Commerical	No GAC - benzene GAC used as a conservative surrogate.
1,2,4-Trichlorobenzene	215	mg/kg	Commerical	
Hexachlorobutadiene	30.7	mg/kg	Commerical	
1,2,3-Trichlorobenzene	102	mg/kg	Commerical	
Dichloromethane	257	mg/kg	Commerical	
Carbon disulphide	11	mg/kg	Commerical	
Xylenols	9180	mg/kg	POS Park	No GAC for group of compounds - EIC GAC for 2,4-dimethylphenol (Xylenol) used to represent group
SVOCs				
Phenol	7600	mg/kg	POS Park	
2-Chlorophenol	1010	mg/kg	POS Park	
2-Methylphenol	46100	mg/kg	POS Park	
Hexachloroethane	20.9	mg/kg	Commerical	
Nitrobenzene	26.6	mg/kg	Commerical	No GAC - aromatic nitro compound. Used in the manufacture of lubricating oils, dyes, pesticides and synthetic rubber. No toxicological information is available on its toxicological effects. Therefore benzene has been used as a conservative surrogate GAC.
4-Methylphenol	46000	mg/kg	POS Park	
Isophorone	26.6	mg/kg	Commerical	No GAC - cyclic ketone compound which is used in the production of polycarbonates. USEPA have classified it has a possible human carcinogen. Therefore benzene has been used a conservative surrogate GAC.
2-Nitrophenol	7600	mg/kg	POS Park	Phenolic compound. It is solid at room temperature and is not easily volatilised. Limited information on toxicological effects in humans. In the absence of any suitable criteria the GAC for phenol has been used as a surrogate.
2,4-Dimethylphenol	9180	mg/kg	POS Park	
Bis(2-chloroethoxy)methane	0.956	mg/kg	Commerical	This compound is used as a solvent and is a haloether. In the absence of any suitable criteria the GAC for the most conservative clorinated halogen (chloromethane) has been used as a surrogate.
2,4-Dichlorophenol	977	mg/kg	POS Park	
4-Chloro-3-methylphenol	46100	mg/kg	POS Park	3-methylphenol criteria used as substitue
2,4,6-trichlorophenol	1010	mg/kg	POS Park	
2,4,5-Trichlorophenol	1010	mg/kg	POS Park	No GAC - 2,4,6-Trichlorophenol use as substitue
2-Methylnaphthalene	193	mg/kg	Commerical	No GAC - Insufficient toxicological criteria to develop assessment criteria. Naphthalene used as surrogate assessment criteria in absence of data
2-Chloronaphthalene	370	mg/kg	Commerical	
Dimethylphthalate	2630	mg/kg	POS Park	Screened against most conservative phthalate (n-Dibutylphthalate) GAC in the absence of a GAC
2,6-Dinitrotoluene	468	mg/kg	POS Park	
2,4-Dinitrotoluene	928	mg/kg	POS Park	
Dibenzofuran	10.8	mg/kg	POS Park	No GAC - Dibenzofuran is a aromatic organic compound which two benzene rings fused to a central furan ring. It is commonly associated with coal tar. It is generally accepted to be relatively non-toxic and does not exhibt "dioxin like" behaviour. Benzo(a)pyrene has been used as a conservative surrogate GAC.
Diethyl phthalate	89300	mg/kg	POS Park	

Screening value	Screening value	Units	ARUP GAC	Justification
Hexachlorobenzene	28.9	mg/kg	POS Park	
Carbazole	10.8	mg/kg	POS Park	No GAC - Carbazole is a aromatic organic compounds consisting of two six membered benzene rings on either side of a five membered nitrogen containing ring. It is a common consistuent of tobacco smoke. There is insufficient evidence on its toxicity to derive a GAC. Therefore benzo(a)pyrene has been used as a conservative surrogate GAC.
Di-n-butyl phthalate	2630	mg/kg	POS Park	
Butyl benzyl phthalate	254000	mg/kg	POS Park	
Environmental Forensics				
4-Nitrophenol	7600	mg/kg	POS Park	Phenolic compound. It is solid at room temperature and is not easily volatilised. Limited information on toxicological effects in humans. In the absence of any suitable criteria the GAC for phenol has been used as a surrogate.
Perylene	10.8	mg/kg	POS Park	No GAC - perylene is a PAH compound. It is not classified as a carcinogen but its derivatives may be considered to be carcinogenic, therefore in the absence of an assessment criteria benzo(a)pyrene GAC has been used a surrogate.
Phthalates				
Bis(2-ethylhexyl)phthalate	16600	mg/kg	POS Park	
Di-n-octyl phthalate	20000	mg/kg	POS Park	
Triazine Pesticides				
Atrazine	379	mg/kg	POS Maintenance	
Organochlorine Pesticides				
Aldrin	7.8	mg/kg	POS Park	
alpha-HCH (alpha-BHC)	46.5	mg/kg	POS Park	
beta-HCH (beta-BHC)	13.3	mg/kg	POS Park	
Dieldrin	12.9	mg/kg	POS Park	
Endosulfan I	1950	mg/kg	POS Maintenance	
Endosulfan II	1960	mg/kg	POS Maintenance	
Organotins				
Tributyltin compounds	42.4	mg/kg	POS Park	
Chlorophenols				
Pentachlorophenol	113	mg/kg	POS Park	
2,3,4,6-Tetrachlorophenol	1000	mg/kg	POS Park	
Others				
Bromoform	714	mg/kg	Commerical	
Azobenzene	10.8	mg/kg	POS Park	Dye compound formed of two phenyl rings. Screened against benzene against as a conversative first assessment
2-Nitroaniline	10.8	mg/kg	POS Park	2-Nitroaniline is an organic compound with the formula $H_2NC_6H_4NO_2$. It is a derivative of aniline, carrying a nitro functional group in position 2. Conservatively screened against benzene in the first instance.
4-Nitroaniline	10.8	mg/kg	POS Park	It is an organic chemical compound, consisting of a benzene ring in which an amino group is para to a nitro group. Therefore screened against benzene as a conservative first assessment
4-Chloroaniline	10.8	mg/kg	POS Park	Used in the industrial production of pesticides, drugs, and dyestuffs. Consists of a benzene ring with nitro and chlorine compounds. Conservatively screened against benzene in the first instance.

Appendix E

E2 Groundwater Assessment Criteria

Screening value	Screening value	Units	Screening standard	Justification
General inorganics				
Total Cyanide	50	ug/l	UK DWS	DWS prioritised
Complex Cyanides	50	ug/l	UK DWS	DWS for total cyanide used
Free Cyanide	50	ug/l	UK DWS	DWS for total cyanide used
Thiocyanate as SCN	50	ug/l	UK DWS	DWS for total cyanide used
Sulphate as SO4	250000	ug/l	UK DWS	DWS prioritised
Sulphide	N/A	ug/l	-	-
Chloride	250	mg/l	UK DWS	DWS prioritised
Fluoride	1500	ug/l	UK DWS	DWS prioritised
Ammoniacal Nitrogen as N	390	ug/l	UK DWS	DWS prioritised
Nitrate as N	11.3	mg/l	UK DWS	DWS for Nitrate as NO3 converted to Nitrate as N (NO3 x 0.2259)
Nitrate as NO3	50	mg/l	UK DWS	DWS prioritised
Nitrite as N	160	ug/l	UK DWS	DWS for Nitrite as NO2 converted to Nitrite as N (NO2 x 0.3257)
Nitrite as NO2	500	ug/l	UK DWS	DWS prioritised
Alkalinity	N/A	mg/l	-	-
Chemical Oxygen Demand (COD)	N/A	mg/l	-	-
Biological Oxygen Demand (BOD)	N/A	mg/l	-	-
Total Oxidised N (Nitrate/-ite)	50	mg/l	UK DWS	DWS for Nitrate as NO3 assumed
Total Suspended Solids	N/A	mg/l	-	-
Hardness - Total	N/A	mg/l	-	-
Bromide	N/A	mg/l	-	Bromide common constituent of groundwater and is naturally occurring
Bromate	0.01	mg/l	UK DWS	DWS prioritised
Phenols				
Catechol	7.7	ug/l	FEQS	EQS for phenol used (no UK DWS available)
Resorcinol	7.7	ug/l	FEQS	EQS for phenol used (no UK DWS available)
Ethylphenol & Dimethylphenol	100	ug/l	FEQS	EQS for methylphenol used (no UK DWS available)
Cresols	100	ug/l	FEQS	EQS for methylphenol used (no UK DWS available)
Naphthols	7.7	ug/l	FEQS	EQS for phenol used (no UK DWS available)
Isopropylphenol	7.7	ug/l	FEQS	EQS for phenol used (no UK DWS available)
Phenol	7.7	ug/l	FEQS	EQS (no UK DWS available)
Trimethylphenol	100	ug/l	FEQS	EQS for methylphenol used (no UK DWS available)
Speciated PAHs				
Naphthalene	2	ug/l	FEQS	EQS (no UK DWS available)
Acenaphthylene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Acenaphthene	2000	ug/l	USEPA	USEPA DWS (no UK DWS available)
Fluorene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Phenanthrene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Anthracene	0.1	ug/l	FEQS	EQS (no UK DWS available)
Fluoranthene	0.0063	ug/l	FEQS	EQS (no UK DWS available)
Pyrene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Benzo(a)anthracene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Chrysene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Benzo(b)fluoranthene	0.1	ug/l	UK DWS	DWS prioritised
Benzo(k)fluoranthene	0.1	ug/l	UK DWS	DWS prioritised
Benzo(a)pyrene	0.01	ug/l	UK DWS	DWS prioritised
Indeno(1,2,3-cd)pyrene	0.1	ug/l	UK DWS	DWS prioritised
Dibenzo(a,h)anthracene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Benzo(g,h,i)perylene	0.1	ug/l	UK DWS	DWS prioritised
Heavy metals and metalloids				
Antimony	5	ug/l	UK DWS	DWS prioritised
Arsenic	10	ug/l	UK DWS	DWS prioritised
Barium	700	ug/l	WHO	WHO (no UK DWS available)

Compound	Notes
PFOA	PHE guidance details that both PFOS and PFOA are essentially non-volatile and general public would not be expected to be exposed via inhalation (Public Heath England – PFOS and PFOA Toxicological Overview (2009))
2,4,5-T 2,4,5-TP 2,4-D Dichlorprop MCPA Mecoprop Fluroxypyr Trichlorpyr Diuron Monuron	According to the Pesticide Properties Database- chemical has low volatility (https://sitem.herts.ac.uk/aeru/ppdb/en/atoz.htm)

Compound	Notes
PFOA	PHE guidance details that both PFOS and PFOA are essentially non-volatile and general public would not be expected to be exposed via inhalation (Public Heath England – PFOS and PFOA Toxicological Overview (2009))
2,4,5-T 2,4,5-TP 2,4-D Dichlorprop MCPA Mecoprop Fluroxypyr Trichlorpyr Diuron Monuron	According to the Pesticide Properties Database- chemical has low volatility (https://sitem.herts.ac.uk/aeru/ppdb/en/atoz.htm)

Compound	Notes
PFOA	PHE guidance details that both PFOS and PFOA are essentially non-volatile and general public would not be expected to be exposed via inhalation (Public Heath England – PFOS and PFOA Toxicological Overview (2009))
2,4,5-T 2,4,5-TP 2,4-D Dichlorprop MCPA Mecoprop Fluroxypyr Trichlorpyr Diuron Monuron	According to the Pesticide Properties Database- chemical has low volatility (https://sitem.herts.ac.uk/aeru/ppdb/en/atoz.htm)

E5 PCB Sheets

PCDDs, PCDFs and dioxin-like compounds worksheet for a commercial land use scenario

This worksheet should be used only in conjunction with *Soil Guideline Values for dioxins, furans and dioxin-like PCBs in soil, Science Report SC050021 / Dioxins SGV*

For each congener/compound, enter the site-specific representative soil concentration in the respective grey box. The Hazard Index is the ratio of the total soil exposure to the oral TDSI.

Substance	Soil Concentration		Exposure Factor		TEF		Average Daily Exposure	Contribution to ADE

PCDDs, PCDFs and dioxin-like compounds worksheet for a commercial land use scenario

This worksheet should be used only in conjunction with *Soil Guideline Values for dioxins, furans and dioxin-like PCBs in soil, Science Report SC050021 / Dioxins SGV*

For each congener/compound, enter the site-specific representative soil concentration in the respective grey box. The Hazard Index is the ratio of the total soil exposure to the oral TDSI.

PCDDs, PCDFs and dioxin-like compounds worksheet for a commercial land use scenario

This worksheet should be used only in conjunction with *Soil Guideline Values for dioxins, furans and dioxin-like PCBs in soil, Science Report SC050021 / Dioxins SGV*

For each congener/compound, enter the site-specific representative soil concentration in the respective grey box. The Hazard Index is the ratio of the total soil exposure to the oral TDSI.

PCDDs, PCDFs and dioxin-like compounds worksheet for a commercial land use scenario

This worksheet should be used only in conjunction with *Soil Guideline Values for dioxins, furans and dioxin-like PCBs in soil, Science Report SC050021 / Dioxins SGV*

For each congener/compound, enter the site-specific representative soil concentration in the respective grey box. The Hazard Index is the ratio of the total soil exposure to the oral TDSI.

PCDDs, PCDFs and dioxin-like compounds worksheet for a commercial land use scenario

This worksheet should be used only in conjunction with *Soil Guideline Values for dioxins, furans and dioxin-like PCBs in soil, Science Report SC050021 / Dioxins SGV*

For each congener/compound, enter the site-specific representative soil concentration in the respective grey box. The Hazard Index is the ratio of the total soil exposure to the oral TDSI.

PCDDs, PCDFs and dioxin-like compounds worksheet for a commercial land use scenario

This worksheet should be used only in conjunction with *Soil Guideline Values for dioxins, furans and dioxin-like PCBs in soil, Science Report SC050021 / Dioxins SGV*

For each congener/compound, enter the site-specific representative soil concentration in the respective grey box. The Hazard Index is the ratio of the total soil exposure to the oral TDSI.

PCDDs, PCDFs and dioxin-like compounds worksheet for a commercial land use scenario

This worksheet should be used only in conjunction with *Soil Guideline Values for dioxins, furans and dioxin-like PCBs in soil, Science Report SC050021 / Dioxins SGV*

For each congener/compound, enter the site-specific representative soil concentration in the respective grey box. The Hazard Index is the ratio of the total soil exposure to the oral TDSI.

Appendix F- Ground Gas Generic Quantitative Risk Assessment

Appendix F

F1 Vapour Risk Assessment Notes

F1.1 Vapour Monitoring

F1.1.1 Vapour samples have been obtained from boreholes installed at each phase of the landfill investigation; an initial sampling round was completed in March 2017 in the boreholes installed as part of the 2016 landfill investigation (Long-term monitoring wells). Further rounds have been completed between July 2018 to March 2019, incorporating the monitoring wells installed during the WVP and LTCP investigations completed in 2018. Monitoring wells sampled included; LF-BH12A, LF-BH10G, LF-BH08G, LF-BH05G, LF-BH03G, LF-BH04G, LF-BH09, LF-BH07, LF-BH06 and LF-BH02 (long-term monitoring wells), BH201, BH203, BH204, BH207, BH213, BH219, BH220, BH226, BWS203, BWS213, BWS2016, WS206 (WVP) and BH216, BH222, BH223, BH232, BWS217, WS224 (LTCP). The vapour samples were obtained by the use of either pressurised gas containers or gas bags which were subsequently tested in the laboratory for;

- bulk gases i.e. methane, carbon dioxide, oxygen etc;
- speciated volatile organic compounds (VOCs);
- odourant gas analysis (hydrogen sulphide);
- C1-C7 hydrocarbons (alkanes & alkene);
- total petroleum hydrocarbon (TPH) in gas samples (aliphatic and aromatic C4 to C12); and
- dioxins and furans.

F1.1.2 During the latest monitoring period samples were collected over an 8-month period, July 2018 to March 2019. The vapour sampling schedule is detailed in Table 1.

Table 1 Vapour Sampling Schedule

Phase of Investigation	No. Samples/ Exploratory Hole I.D.s	Sampling Dates	Report No./Analysis Suites
Landfill SI 2016 (Long-term monitoring wells)	10: LF-BH12A, LF-BH10G, LF-BH08G, LF-BH05G, LF-BH03G, LF-BH04G, LF-BH09, LF-BH07, LF-BH06 and LF-BH02	March 2017	
	7: BH06, BH07, BH12A, BH03G, BH05G, BH08G, BH10GA	July 2018	*Report No. 469912 (VOCs, TPH in Gas, Bulk Gas, Odourant Gas, TICs)*

Phase of Investigation	No. Samples/ Exploratory Hole I.D.s	Sampling Dates	Report No./Analysis Suites
			Report No. 756028 *(Dioxins and Furans, Butane, Propane, Ethane and Ethene, arsenic, mercury, acetaldehyde, formaldehyde, Total VOCs)*

	4: BH03G, BH08G, BH06, BH05G,	September 2018	*Round 2:* *Report No. 768868-1* (VOC suite A)
	7: BH06, BH07, BH12A, BH06A, BH03G, BH05G	October 2018	*Report No. 498383* *(VOCs, TPH in Gas, Odourant Gas, Bulk Gas, hydrogen sulphide)* *Report No. 778109* *(Dioxins and Furans, Butane, Propane, Ethane and Ethene, arsenic, mercury, acetaldehyde, formaldehyde, VOC suite A)*
	7:BH05G, BH06, BH07, BH06A, BH12A, BH03G, BH08G	4-6th December 2018	*Report Nos. 498380 & 488438* *(VOCs, TPH in Gas, Odourant Gas, Bulk Gas, TICs, hydrogen sulphide)* *Report No. 788572-1* *(Dioxins and Furans, Butane, Propane, Ethane and Ethene, arsenic, mercury, acetaldehyde, formaldehyde, VOC suite A)*

Phase of Investigation	No. Samples/ Exploratory Hole I.D.s	Sampling Dates	Report No./Analysis Suites
	7: BH05G, BH06, BH07, BH06A, BH12A, BH03G, BH08G	22 Feb 2019	Report No. 804733 *(Dioxins and Furans, Butane, Propane, Ethane and Ethene, arsenic, mercury, acetaldehyde, formaldehyde, VOC suite A)*
WVP 2018	12: BH201, BH203, BH204, BH207, BH213, BH219, BH220, BH226, BWS203, BWS213, BWS216, WS206	August 2018 Sept 2018 Oct 2018	Round 1: *Report No. 472329* (*Bulk Gas + ethane,*) Round 2: *Report Nos. 475457 & 475468 (VOCs, Bulk Gas, C1- C7Hydrocarbons, Odourant Gas, TICs, hydrogen sulphide)* Round 3: *Report No. 478040* (*Bulk Gas, VOC Total, C1-C7 Hydrocarbons & odourant gases, hydrogen sulphide*)
LTCP 2019	6: BH216, BH222, BH223, BH232, BWS217, WS224	February 2019 March 2019	Round 1: *Report No. 495512* *(VOCs, Bulk Gas, TICs)* Round 2: *Report No. 499439* *(VOCs, Bulk Gas, C1C7 Hydrocarbons, Odourant Gas, TICs)*

F1.2 Summary of Analysis Results

Volatile Organic Compounds

F1.2.1 A summary of the range of contaminant vapour concentrations detected above the laboratory limit of detection (LOD) in all boreholes in 2018-2019 is provided in Table 2.

F1.2.2 The limit of detection noted on the analysis certificates for the 2018/2019 monitoring results varies for each determinand and between borehole samples due to dilutions needed to be conducted on the samples.

Table 2 Summary of Vapour Analysis Results above LOD July 2018 to March 2019 (μg/m^3)

Contaminant	CAS No.	Min.	Max.	Median	Average	No. above LOD/ (sample No.)

* Dataset includes additional results from TPH in Gas Suite

+ alternative suite A, 4 sets of results for long-term monitoring wells only, concentration calculated by laboratory from ng

TPH in Gas Suite

F1.2.3 TPH in gas suite was analysed on 4No. monitoring visits (July to December 2018) in gas samples obtained from the long-term monitoring wells installed in the WVP in 2016. A summary of the results is provided in Table 3, below.

Table 3 Summary of TPH in Gas Suite above LOD (ug/m³)

Compound	Max.	Min.	Average	Median	No.>LOD (28)
TPH (C4-C6)	62200	57.2	7736.52	2424.50	28
TPH (C6-C8)	50200	42.2	11613.78	4003.50	28
TPH (C8-C10)	74400	117	14544.04	10400	25
TPH (C10-C12)	22100	158	4273.16	3070	19
TPH (C4-C12)	206000	219	39431.68	24500	25
Aliphatic (C4-C6)	62200	57.2	7736.52	2424.50	28
Aliphatic (C6-C8)	50200	32.2	11988.77	7300	27
Aliphatic (C8-C10)	71600	103	14102.08	9460	25
Aliphatic (C10-C12)	22100	158	4273.16	3070	19
Aromatic (EC5-EC7)	294	5.69	88.02	47.20	8
Aromatic (EC7-EC8)	322	6.46	85.12	25.10	10
Aromatic (EC8-EC10)	2980	56.1	933.35	237.50	12

Aromatic EC10-EC12, MTBE, and naphthalene were not detected above the limit of detection, although the LODs were highly variable and at high concentrations in some instances.

Odourant and C-C7 Hydrocarbons

F1.2.4 Odourant C1-C7 Hydrocarbons, all alkanes with the exception of ethene, were analysed in gas samples from long-term monitoring wells between July 2018 to February 2019 and in monitoring wells installed in WVP in 2018 on 2No. occasions (September & October 2018) with 1No. round of sampling from the LTCP in March 2019, results above limits of detection are summarised in Table 4 below:

Table 4 Summary of C1-C7 Hydrocarbons Analysis (ppm)

Compound	CAS No.	LOD	Min.	Max.	Median	Average	No. >LOD (sample No.)
Hydrogen Sulphide	7783-06-4	<1ppm	0	9	0	0.367	79(590)^
Propane	74-98-6	<1ppm	1.07	27.5	7.03	9.77	16 (65)

Compound	CAS No.	LOD	Min.	Max.	Median	Average	No. >LOD (sample No.)
iso-Butane	75-28-5	<1ppm	1.13	2.35	1.36	1.55	4 (11)
Butane	106-97-8	<1ppm	1.21	31	2.61	4.77	14 (65)
Pentane	109-66-0	<1ppm	1.17	2.08	1.625	1.625	2 (30)
Heptane	142-82-5	<1ppm	1.0	1.03	1.015	1.015	2 (30)

^H_2S dataset includes spot monitoring and laboratory analysis – odourant gas

Ethane, ethene, iso-pentane and hexane were not recorded above the limit of detection throughout the monitoring period. Although hexane was recorded above the LOD in the VOC suite, see **Error! Reference source not found.** above.

Bulk Gas Analysis

F1.2.5 Bulk Gas analysis was also completed on gas samples during the 2018/2019 monitoring period from all monitoring wells, a summary of the results is provided in Table 5.

Table 5 Summary of Bulk Gas Analysis

Bulk gases	Units	LOD	Min.	Max.	Median	Average
Hydrogen	%	<0.5	<0.5	<0.5	<0.5	<0.5
Oxygen	%	<0.5	0.547	21.7	13.9	11.47
Nitrogen	%	<1	9.24	84.6	78.2	63.7
Carbon monoxide	%	<0.05	<0.05	<0.05	<0.05	<0.05
Methane	%	<0.05	0.0581	62.9	25.6	28
Carbon Dioxide	%	<0.05	0.06	27.2	6.84	8.78

Dioxins and Furans

F1.2.6 Gas samples taken from the long-term monitoring wells were analysed for PCDD and PCDFs on 5No. occasions between July 2018 and February 2019. PCDD and PCDFs were recorded above the limit of detection in several boreholes on the first two monitoring rounds (see Table 6), subsequently all readings were below their respective LODs.

Table 6 Dioxins and Furans >LOD (ng)

Compound	Min.	Max.	No. >LOD /35	Borehole No.
1,2,3,7,8-Pentachlorodibenzo-p-dioxin	0.029	0.029	1	10GA
1,2,3,4,7,8-Hexachlorodibenzo-p-dioxin	0.0087	0.026	2	06,10GA
1,2,3,6,7,8-	0.013	0.041	2	06,10GA

Compound	Min.	Max.	No. >LOD /35	Borehole No.
Hexachlorodibenzo-p-dioxin				
1,2,3,7,8,9-Hexachlorodibenzo-p-dioxin	0.008	0.013	2	06,10GA
1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin	0.042	0.094	2	06,10GA
2,3,7,8-Tetrachlorodibenzofuran	0.014	0.033	4	05,06,08, 10GA
1,2,3,7,8-Pentachlorodibenzofuran	0.011	0.038	4	05,06,08, 10GA
2,3,4,7,8-Pentachlorodibenzofuran	0.011	0.094	5	05,06,07,08, 10GA
1,2,3,4,7,8-Hexachlorodibenzofuran	0.008	0.062	4	06,08, 10GA
1,2,3,6,7,8-Hexachlorodibenzofuran	0.0063	0.048	4	03,06,08, 10GA
2,3,4,6,7,8-Hexachlorodibenzofuran	0.0048	0.075	4	03,06,08, 10GA
1,2,3,4,6,7,8-Heptachlorodibenzofuran	0.0098	0.099	5	06,07,08, 10GA

F1.2.7 The risk from Dioxins has been assessed using the Environment Agency (EA) 'PCDD, PCDFs and dioxin-like compounds worksheet for a commercial land use scenario' Worksheet, see Section 9.3 of Volume 1 of the DCO DQRA. Hazard Indices (HI) less than 1 were calculated indicating these compounds are not considered a risk to human health.

F1.3 Identification of Priority Compounds

F1.3.1 Due to the significant number of VOCs and trace gas components detected above the LOD it was necessary to prioritise the compounds of greater potential risk for further assessment

F1.3.2 The EA have developed a method of ranking the significance of trace components in landfill gas according to their potential toxicity and odour. Two scoring systems have been devised based on either the toxicological or odour importance combined with typical average or median concentrations in landfill gas to produce a toxicity significance score and odour significance score. This was completed for 174No. compounds of the over 500 compounds which can potentially be present as trace components of landfill gas. The significance ranking was initially completed in 2002 and reported in R & D Technical Report P1-

438/TR[1] using 2No. monitoring events for 1 landfill and from 2 different aged waste (3years and 17 years since emplacement). The rankings were further refined in 2004 (P1-491-TR)[2] with trace gas concentrations taken from a wider study of UK landfills of different waste types and maturity to increase representativeness.

F1.3.3 P1-438 notes the ranking was completed using a logarithmic scale, and therefore the substances would have to be detected at concentrations an order of magnitude above that recorded in the database before it would alter the score used in the ranking. The results of the Eaton Green Landfill monitoring have generally not identified any compounds at average concentrations exceeding the average concentrations in the P-149 database. Non-detects were inputted at the highest stated limit of detection, due to the variable LOD as a precautionary approach, in accordance with P1-438-TR to identify maximum concentrations.

F1.3.4 To identify priority compounds requiring further assessment the toxicity significance ranking presented in Table 9 of P1-149-TR was applied. This identifies the 37 substances with the highest score for potential toxic impact. The substances ranked in priority of odour importance was also referenced (P1-149-TR, Table 10), in combination, this identified 25No. compounds for further assessment.

F1.3.5 The trace compounds identified as described above were subject to detailed quantitative risk assessment using the CLEA model v1.071[3]. In addition to these compounds the TPH in gas compounds including toluene, ethylbenzene and xylenes (TEX) were also assessed using the CLEA model as these determinands were consistently above the LOD throughout the monitoring period.

F1.3.6 Although several of the alkane gases were noted to be elevated, only propane and butane were noted as consistently elevated. Neither compound are identified within the priority toxic or odour tables produced by the EA. No further assessment has been completed on these compounds, as they are not considered to be of significant risk to the occupants of the proposed development.

F1.3.7 The CLEA assessment was based on chorionic exposure for an average adult female worker in a commercial setting, which

[1] Environment Agency (2002) Investigation of the composition, emissions and effects of trace components in landfill gas. R&D Technical Report P1-438/TR, Environment Agency, Bristol

Appendix G – Controlled Waters Generic Quantitative Risk Assessment

Appendix G

G1 Groundwater Assessment Criteria

Screening value	Screening value	Units	Screening standard	Justification
General inorganics				
Total Cyanide	50	ug/l	UK DWS	DWS prioritised
Complex Cyanides	50	ug/l	UK DWS	DWS for total cyanide used
Free Cyanide	50	ug/l	UK DWS	DWS for total cyanide used
Thiocyanate as SCN	50	ug/l	UK DWS	DWS for total cyanide used
Sulphate as SO4	250000	ug/l	UK DWS	DWS prioritised
Sulphide	N/A	ug/l	-	-
Chloride	250	mg/l	UK DWS	DWS prioritised
Fluoride	1500	ug/l	UK DWS	DWS prioritised
Ammoniacal Nitrogen as N	390	ug/l	UK DWS	DWS prioritised
Nitrate as N	11.3	mg/l	UK DWS	DWS for Nitrate as NO3 converted to Nitrate as N (NO3 x 0.2259)
Nitrate as NO3	50	mg/l	UK DWS	DWS prioritised
Nitrite as N	160	ug/l	UK DWS	DWS for Nitrite as NO2 converted to Nitrite as N (NO2 x 0.3257)
Nitrite as NO2	500	ug/l	UK DWS	DWS prioritised
Alkalinity	N/A	mg/l	-	-
Chemical Oxygen Demand (COD)	N/A	mg/l	-	-
Biological Oxygen Demand (BOD)	N/A	mg/l	-	-
Total Oxidised N (Nitrate/-ite)	50	mg/l	UK DWS	DWS for Nitrate as NO3 assumed
Total Suspended Solids	N/A	mg/l	-	-
Hardness - Total	N/A	mg/l	-	-
Bromide	N/A	mg/l	-	Bromide common constituent of groundwater and is naturally occurring
Bromate	0.01	mg/l	UK DWS	DWS prioritised
Phenols				
Catechol	7.7	ug/l	FEQS	EQS for phenol used (no UK DWS available)
Resorcinol	7.7	ug/l	FEQS	EQS for phenol used (no UK DWS available)
Ethylphenol & Dimethylphenol	100	ug/l	FEQS	EQS for methylphenol used (no UK DWS available)
Cresols	100	ug/l	FEQS	EQS for methylphenol used (no UK DWS available)
Naphthols	7.7	ug/l	FEQS	EQS for phenol used (no UK DWS available)
Isopropylphenol	7.7	ug/l	FEQS	EQS for phenol used (no UK DWS available)
Phenol	7.7	ug/l	FEQS	EQS (no UK DWS available)
Trimethylphenol	100	ug/l	FEQS	EQS for methylphenol used (no UK DWS available)
Speciated PAHs				
Naphthalene	2	ug/l	FEQS	EQS (no UK DWS available)
Acenaphthylene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Acenaphthene	2000	ug/l	USEPA	USEPA DWS (no UK DWS available)
Fluorene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Phenanthrene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Anthracene	0.1	ug/l	FEQS	EQS (no UK DWS available)
Fluoranthene	0.0063	ug/l	FEQS	EQS (no UK DWS available)
Pyrene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Benzo(a)anthracene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Chrysene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Benzo(b)fluoranthene	0.1	ug/l	UK DWS	DWS prioritised
Benzo(k)fluoranthene	0.1	ug/l	UK DWS	DWS prioritised
Benzo(a)pyrene	0.01	ug/l	UK DWS	DWS prioritised
Indeno(1,2,3-cd)pyrene	0.1	ug/l	UK DWS	DWS prioritised
Dibenzo(a,h)anthracene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Benzo(g,h,i)perylene	0.1	ug/l	UK DWS	DWS prioritised
Heavy metals and metalloids				
Antimony	5	ug/l	UK DWS	DWS prioritised
Arsenic	10	ug/l	UK DWS	DWS prioritised
Barium	700	ug/l	WHO	WHO (no UK DWS available)
Beryllium	4	ug/l	USEPA	USEPA (no UK DWS available)
Boron	1000	ug/l	UK DWS	DWS prioritised
Cadmium	5	ug/l	UK DWS	DWS prioritised
Calcium	N/A	mg/l	-	-
Chromium VI	3.4	ug/l	FEQS	EQS (no UK DWS available)
Chromium III	4.7	ug/l	FEQS	EQS (no UK DWS available)
Chromium Total	50	ug/l	UK DWS	DWS prioritised
Copper	2000	ug/l	UK DWS	DWS prioritised
Iron	0.2	mg/l	UK DWS	DWS prioritised
Lead	10	ug/l	UK DWS	DWS prioritised
Magnesium	N/A	mg/l	-	-
Manganese	50	ug/l	UK DWS	DWS prioritised
Mercury	1	ug/l	UK DWS	DWS prioritised
Molybdenum	70	ug/l	WHO	WHO (no UK DWS available)
Nickel	20	ug/l	UK DWS	DWS prioritised
Potassium	N/A	mg/l	-	-
Selenium	10	ug/l	UK DWS	DWS prioritised
Sodium	50	mg/l	WHO	WHO (no UK DWS available)
Vanadium	20	ug/l	FEQS	EQS (no UK DWS available)
Zinc	5000	ug/l	USEPA	USEPA (no UK DWS available)

Screening value	Screening value	Units	Screening standard	Justification
Monoaromatics				
Benzene	1	ug/l	UK DWS	DWS prioritised
Toluene	74	ug/l	FEQS	EQS (no UK DWS available)
Ethylbenzene	20	ug/l	FEQS	EQS (no UK DWS available)
Xylenes	30	ug/l	FEQS	EQS (no UK DWS available)
MTBE	15	ug/l	WHO	WHO threshold for taste and odour in drinking water (no UK DWS available)
Petroleum hydrocarbons				
TPH	N/A	ug/l	-	
TPH >C5-C6 Aliphatics	15000	ug/l	WHO	WHO (no UK DWS available)
TPH >C6-C8 Aliphatics	15000	ug/l	WHO	WHO (no UK DWS available)
TPH >C8-C10 Aliphatics	300	ug/l	WHO	WHO (no UK DWS available)
TPH >C10-C12 Aliphatics	300	ug/l	WHO	WHO (no UK DWS available)
TPH >C12-C16 Aliphatics	300	ug/l	WHO	WHO (no UK DWS available)
TPH >C16-C21 Aliphatics	300	ug/l	WHO	WHO guideline for TPH >C12-C16 Aliphatics used (no UK DWS available)
TPH >C21-C35 Aliphatics	300	ug/l	WHO	WHO guideline for TPH >C12-C16 Aliphatics used (no UK DWS available)
TPH-CWG - Aliphatic >C16 - C35	300	ug/l	WHO	WHO guideline for TPH >C12-C16 Aliphatics used (no UK DWS available)
TPH-CWG - Aliphatic >C35 - C44	300	ug/l	WHO	WHO guideline for TPH >C12-C16 Aliphatics used (no UK DWS available)
C5-C35 Aliphatics	N/A	ug/l	-	-
TPH-CWG - Aliphatic (C5 - C44)	N/A	ug/l	-	-
TPH >C5-C6 Aromatics	10	ug/l	WHO	WHO (no UK DWS available)
TPH >C7-C8 Aromatics	700	ug/l	WHO	WHO (no UK DWS available)
TPH >C8-C9 Aromatics	300	ug/l	WHO	WHO (no UK DWS available)
TPH >C9-C10 Aromatics	300	ug/l	WHO	WHO (no UK DWS available)
TPH >C8-C10 Aromatics	300	ug/l	WHO	WHO (no UK DWS available)
TPH >C10-C12 Aromatics	90	ug/l	WHO	WHO (no UK DWS available)
TPH >C12-C16 Aromatics	90	ug/l	WHO	WHO (no UK DWS available)
TPH >C16-C21 Aromatics	90	ug/l	WHO	WHO (no UK DWS available)
TPH >C21-C35 Aromatics	90	ug/l	WHO	WHO (no UK DWS available)
TPH >C35-C44 Aromatics	90	ug/l	WHO	WHO guideline for TPH >C21-C35 Aromatics used (no UK DWS available)
C5-C35 Aromatics	N/A	ug/l	-	-
C5-C35 Aromatics	N/A	ug/l	-	-
VOCs				
Chloromethane	20	ug/l	FEQS	EQS for dichloromethane used (no UK DWS available)
Chloroethane	3	ug/l	UK DWS	DWS for 1,2-dichloroethane used
Bromomethane	100	ug/l	UK DWS	DWS for total trihalomethanes used which includes dibromomethane
Vinyl Chloride	0.5	ug/l	UK DWS	DWS prioritised
Trichlorofluoromethane	2.5	ug/l	FEQS	EQS for trichloromethane used (no UK DWS available)
1,1-Dichloroethene	7	ug/l	USEPA	USEPA (no UK DWS available)
1,1,2-Trichloro-1,2,2-trifluoroethane	400	ug/l	FEQS	EQS for 1,1,2-trichloroethane used (no UK DWS available)
Cis-1,2 Dichloroethene	50	ug/l	WHO	WHO (no UK DWS available)
1,1 -Dichloroethane	3	ug/l	UK DWS	DWS for 1,2-dichloroethane used
2,2-Dichloropropane	40	ug/l	WHO	WHO for 1,2-dichloropropane used (no UK DWS available)
Trichloromethane	2.5	ug/l	FEQS	EQS (no UK DWS available)
1,1,1-Trichloroethane	100	ug/l	FEQS	EQS (no UK DWS available)
1,2-Dichloroethane	3	ug/l	UK DWS	DWS prioritised
1,1-Dichloropropene	20	ug/l	WHO	WHO for 1,3-dichloropropene used (no UK DWS available)
Trans-1,2 Dichloroethene	50	ug/l	WHO	WHO (no UK DWS available)
Tetrachloromethane	3	ug/l	UK DWS	DWS prioritised
1,2-Dichloropropane	40	ug/l	WHO	WHO (no UK DWS available)
Trichloroethene	10	ug/l	UK DWS	DWS prioritised
Dibromomethane	100	ug/l	UK DWS	DWS prioritised
Bromodichloromethane	100	ug/l	UK DWS	DWS prioritised
Cis-1,3 Dichloropropene	20	ug/l	WHO	WHO (no UK DWS available)
Trans-1,3 Dichloropropene	20	ug/l	WHO	WHO (no UK DWS available)
1,1,2-Trichloroethane	400	ug/l	FEQS	EQS (no UK DWS available)
1,3-Dichloropropane	40	ug/l	WHO	WHO for 1,2-dichloropropane used (no UK DWS available)
Dibromochloromethane	100	ug/l	WHO	WHO (no UK DWS available)
Tetrachloroethene	10	ug/l	UK DWS	DWS prioritised
1,2-Dibromoethane	0.4	ug/l	WHO	WHO (no UK DWS available)
Chlorobenzene	0.4	ug/l	EQS	EQS for trichlorobenzene (no UK DWS available)
1,1,1,2-Tetrachloroethane	400	ug/l	USEPA	USEPA for 1,1,2,2-tetrachloroethane used (no UK DWS available)
m,p-Xylenes	30	ug/l	FEQS	EQS for total xylenes (no UK DWS available)
Styrene	20	ug/l	WHO	WHO (no UK DWS available)
Tribromomethane	100	ug/l	UK DWS	DWS for total trihalomethanes used which includes dibromomethane
o-Xylene	30	ug/l	FEQS	EQS for total xylenes (no UK DWS available)
1,1,2,2-Tetrachloroethane	400	ug/l	USEPA	USEPA (no UK DWS available)
Iso-propylbenzene	1	ug/l	UK DWS	UK DWS for benzene used
Bromobenzene	1	ug/l	UK DWS	UK DWS for benzene used
Propylbenzene	1	ug/l	UK DWS	UK DWS for benzene used
2-Chlorotoluene	74	ug/l	FEQS	EQS for toluene used (no UK DWS available)
4-Chlorotoluene	74	ug/l	FEQS	EQS for toluene used (no UK DWS available)
1,3,5 Trimethylbenzene	1	ug/l	UK DWS	UK DWS for benzene used
tert-Butylbenzene	1	ug/l	UK DWS	UK DWS for benzene used
1,2,4 Trimethylbenzene	1	ug/l	UK DWS	UK DWS for benzene used
sec-Butylbenzene	1	ug/l	UK DWS	UK DWS for benzene used

Screening value	Screening value	Units	Screening standard	Justification
1,3 Dichlorobenzene	3000	ug/l	USEPA	USEPA (no UK DWS available)
p-Isopropyltoluene	74	ug/l	FEQS	EQS for toluene used (no UK DWS available)
1,2-Dichlorobenzene	1000	ug/l	WHO	WHO (no UK DWS available)
1,4 Dichlorobenzene	300	ug/l	WHO	WHO (no UK DWS available)
n-Butylbenzene	1	ug/l	UK DWS	UK DWS for benzene used
1,2-Dibromo-3-chloropropane	1	ug/l	WHO	WHO (no UK DWS available)
1,2,4-Trichlorobenzene	70	ug/l	USEPA	USEPA (no UK DWS available)
Hexachlorobutadiene	0.6	ug/l	WHO	WHO (no UK DWS available)
2,6 Chloronitrotoluene	74	ug/l	FEQS	EQS for toluene used (no UK DWS available)
4,2 Chloronitrotoluene	74	ug/l	FEQS	EQS for toluene used (no UK DWS available)
4,3 Chloronitrotoluene	74	ug/l	FEQS	EQS for toluene used (no UK DWS available)
2,4 Chloronitrotoluene	74	ug/l	FEQS	EQS for toluene used (no UK DWS available)
2,5 Chloronitrotoluene	74	ug/l	FEQS	EQS for toluene used (no UK DWS available)
1,2,3-Trichlorobenzene	0.4	ug/l	FEQS	EQS for trichlorobenzene (no UK DWS available)
1,2,3-Trichloropropane	40	ug/l	WHO	WHO for 1,2-dichloropropane used (no UK DWS available)
1,3,5-Trichlorobenzene	0.4	ug/l	FEWS	EQS for trichlorobenzene (no UK DWS available)
Bromochloromethane	100	ug/l	WHO	WHO for dibromochloromethane used (no UK DWS available)
Dichloromethane	20	ug/l	FEQS	EQS (no UK DWS available)
Carbon disulphide	10	ug/l	Default	No suitable published criteria available default value of 10ug/l adopted
Dichlorodifluoromethane	20	ug/l	FEQS	EQS used for dichloromethane (no UK DWS available)
SVOCs				
Phenol	7.7	ug/l	FEQS	EQS (no UK DWS available)
2-Chlorophenol	50	ug/l	FEQS	EQS (no UK DWS available)
Bis(2-chloroethyl)ether	1000	ug/l	USEPA	USEPA for bis(2-chloro-1-methylethyl)ether used (no UK DWS available)
Bis(2-chloroisopropyl)ether	1000	ug/l	USEPA	USEPA for bis(2-chloro-1-methylethyl)ether used (no UK DWS available)
2-Methylphenol	100	ug/l	FEQS	EQS for methylphenol used (no UK DWS available)
Hexachloroethane	40	ug/l	USEPA	USEPA (no UK DWS available)
Nitrobenzene	1	ug/l	UK DWS	UK DWS for benzene used
4-Methylphenol	100	ug/l	FEQS	EQS for methylphenol used (no UK DWS available)
Isophorone	7000	ug/l	USEPA	USEPA (no UK DWS available)
2-Nitrophenol	7.7	ug/l	FEQS	EQS for phenol used (no UK DWS available)
2,4-Dimethylphenol	100	ug/l	FEQS	EQS for methylphenol used (no UK DWS available)
Bis(2-chloroethoxy)methane	10	ug/l	Default	No suitable published criteria available default value of 10ug/l adopted
2,4-Dichlorophenol	4.2	ug/l	FEQS	EQS (no UK DWS available)
4-Chloro-3-methylphenol	40	ug/l	FEQS	EQS (no UK DWS available)
2,4,6-trichlorophenol	200	ug/l	WHO	WHO (no UK DWS available)
2,4,5-Trichlorophenol	200	ug/l	WHO	WHO for 2,4,6-trichlorophenol used (no UK DWS available)
2-Methylnaphthalene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
2-Chloronaphthalene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Dimethylphthalate	800	ug/l	FEQS	EQS (no UK DWS available)
2,6-Dinitrotoluene	100	ug/l	USEPA	USEPA for 2,4-dinitrotoluene used (no UK DWS available)
2,4-Dinitrotoluene	100	ug/l	USEPA	USEPA (no UK DWS available)
Dibenzofuran	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Diethyl phthalate	200	ug/l	FEQS	EQS (no UK DWS available)
Bromophenyl phenyl ether	10	ug/l	Default	No suitable published criteria available default value of 10ug/l adopted
Hexachlorobenzene	1	ug/l	USEPA	USEPA (no UK DWS available)
Carbazole	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
Di-n-butyl phthalate	8	ug/l	FEQS	EQS (no UK DWS available)
Butyl benzyl phthalate	7.5	ug/l	FEQS	EQS (no UK DWS available)
PCBs by GC-ECD - WHO 12				
PCB Congener 77	25	ug/l	FEQS	EQS (no UK DWS available)
PCB Congener 81	25	ug/l	FEQS	EQS (no UK DWS available)
PCB Congener 105	25	ug/l	FEQS	EQS (no UK DWS available)
PCB Congener 114	25	ug/l	FEQS	EQS (no UK DWS available)
PCB Congener 118	25	ug/l	FEQS	EQS (no UK DWS available)
PCB Congener 123	25	ug/l	FEQS	EQS (no UK DWS available)
PCB Congener 126	25	ug/l	FEQS	EQS (no UK DWS available)
PCB Congener 156	25	ug/l	FEQS	EQS (no UK DWS available)
PCB Congener 157	25	ug/l	FEQS	EQS (no UK DWS available)
PCB Congener 167	25	ug/l	FEQS	EQS (no UK DWS available)
PCB Congener 169	25	ug/l	FEQS	EQS (no UK DWS available)
PCB Congener 189	25	ug/l	FEQS	EQS (no UK DWS available)
PCBs	25	ug/l	FEQS	EQS (no UK DWS available)
Environmental Forensics				
PFOS	0.3	ug/l	FEQS	DWS
PFOA	0.3	ug/l	FEQS	DWS for PFOS used
Metaldehyde	0.1	ug/l	UK DWS	DWS for other pesticides prioritised
Chloronitrotoluenes (sum)	10	ug/l	FEQS	EQS (no DWS available). EQS is an EA operational EQS and is not listed within WFD.
Chlorbufam	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Chloroxuron	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Chlorpropham	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Ethiofencarb	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Phenmedipham	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Propham	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Dimefuron	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised

Screening value	Screening value	Units	Screening standard	Justification
Metoxuron	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Pencycuron	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
o,p-Methoxychlor	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Demeton-s-methyl	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Diclofop	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Fenvalerate	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Cyhalothrin	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Ametryn	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Atrazine-methoxy	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Bromacil	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Flamprop	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Flamprop-isopropyl	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Prometon	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Simetryn	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
4-Nitrophenol	7.7	ug/l	FEQS	EQS for phenol used (no UK DWS available)
Hexachlorocyclopentadiene	50	ug/l	USEPA	USEPA (no UK DWS available)
Perylene	2	ug/l	FEQS	EQS for naphthalene used (no UK DWS available)
n-Nitroso-n-dipropylamine	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Carbamates				
Pirimicarb	100	ng/l	UK DWS	DWS 'other pesticides' prioritised
Carbetamide	100	ng/l	UK DWS	DWS 'other pesticides' prioritised
Phthalates				
Bis(2-ethylhexyl)phthalate	8	ug/l	WHO	WHO for di(2-ethylhexyl)phthalate used (no UK DWS available)
Di-n-octyl phthalate	20	ug/l	FEQS	EQS (no UK DWS available)
Total phthalates	N/A	mg/l	-	-
Glycols				
Ethylene Glycol	0.01	mg/l	Default	No suitable published criteria available default value of 10ug/l adopted
Diethylene Glycol	0.01	mg/l	Default	No suitable published criteria available default value of 10ug/l adopted
1,2-Propanediol	0.01	mg/l	Default	No suitable published criteria available default value of 10ug/l adopted
Triazine Pesticides				
Atrazine	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Simazine	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Prometryn	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Propazine	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
Terbuthylazine	0.1	ug/l	UK DWS	DWS 'other pesticides' prioritised
